Secretion
Mechanotransduction

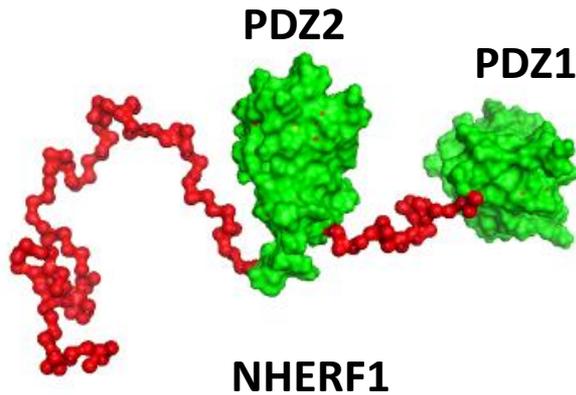

Receptor trafficking

Adapter proteins **NHERF1** and **Ezrin** regulate membrane receptor and ion channel assembly, trafficking and signaling

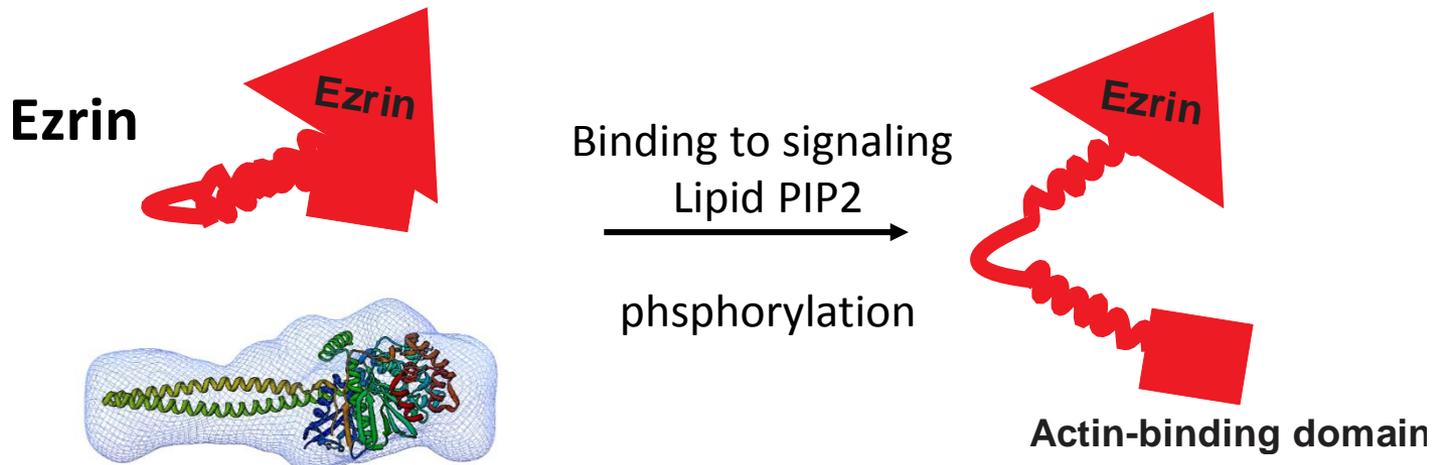

Linking the cell membrane to the F-actin cytoskeleton

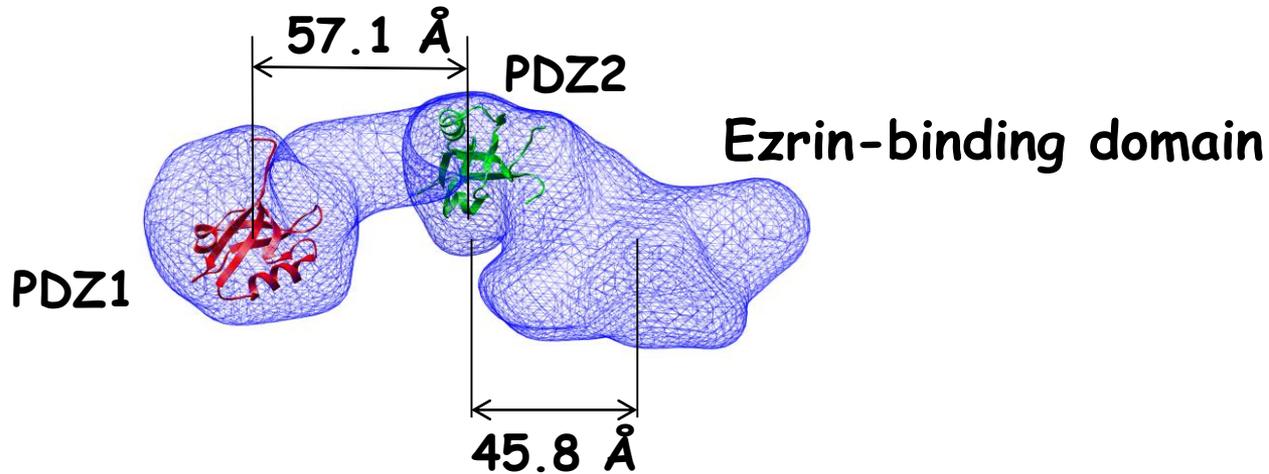

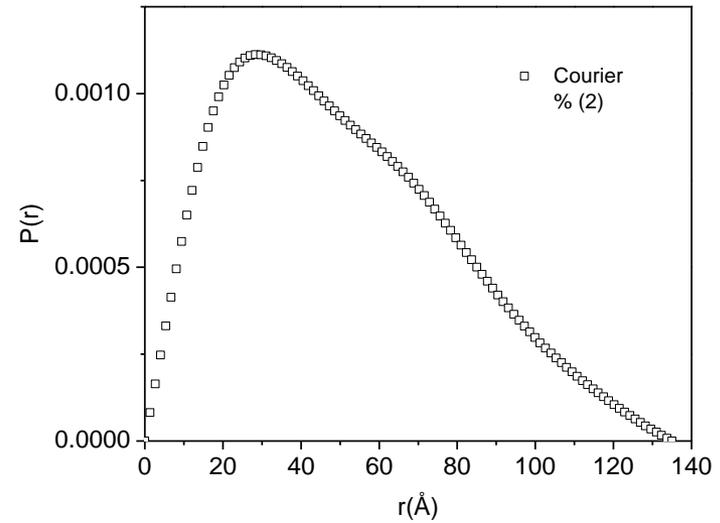

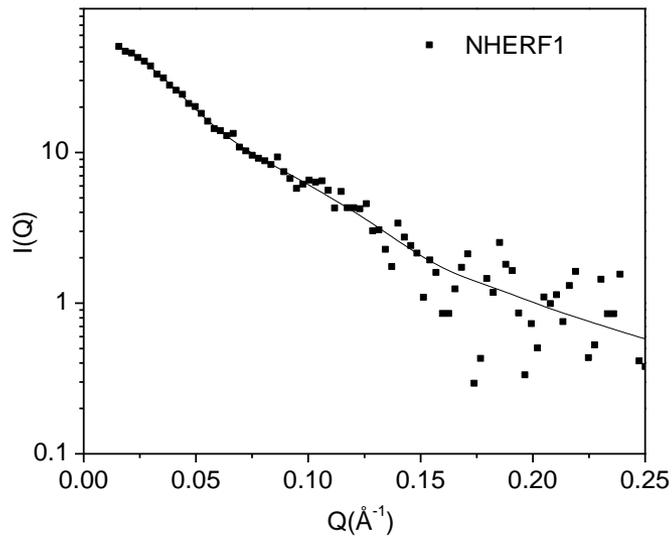

Multi-domain adapter proteins: Intramolecular interactions regulate protein-protein assembly

“Supra-tertiary Structure”

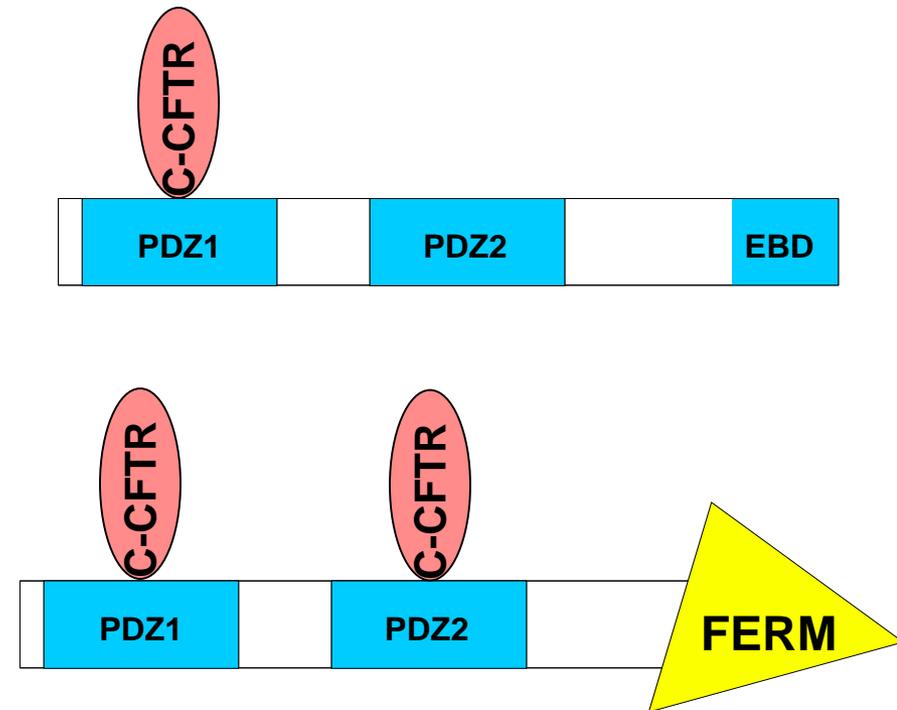

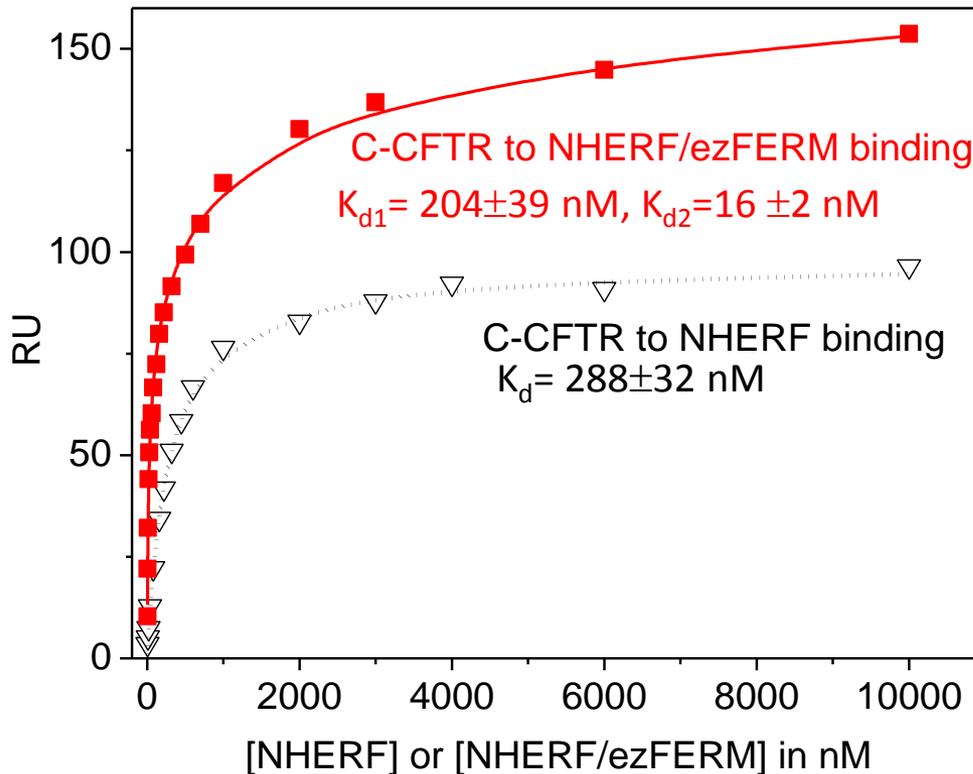

NHERF1 alone in solution by SAXS

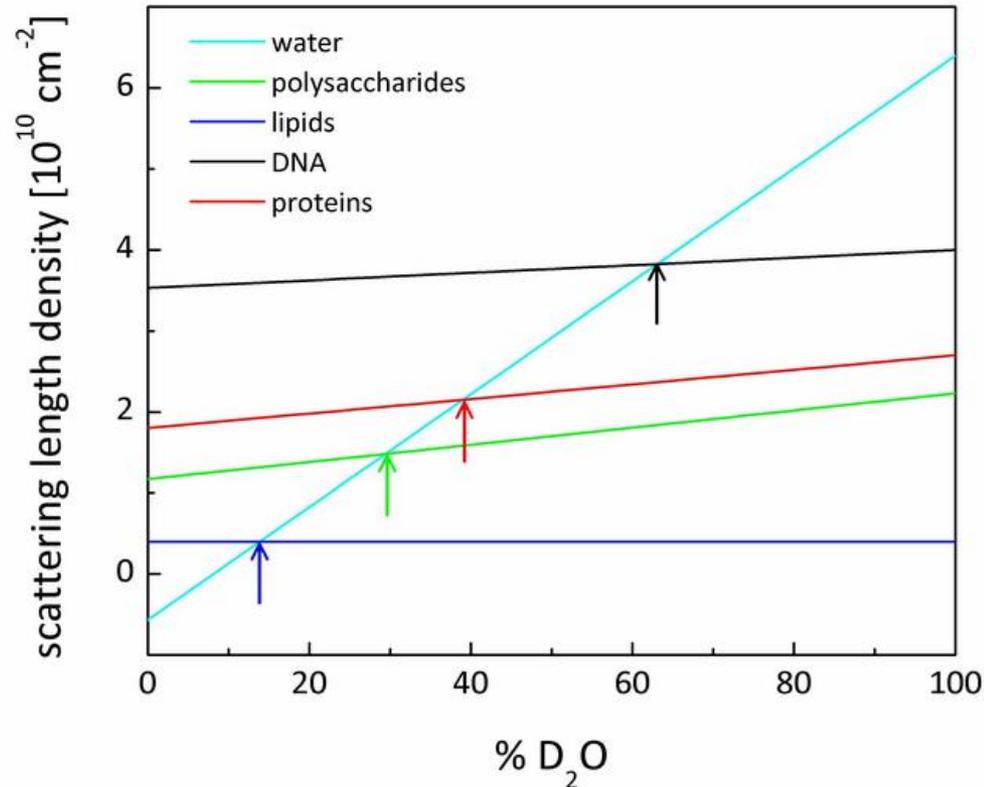

Ezrin positively modulates NHERF1 to assemble protein complexes

Changes stoichiometry of NHERF1 binding to C-CFTR

1:1 changes to 1:2 binding

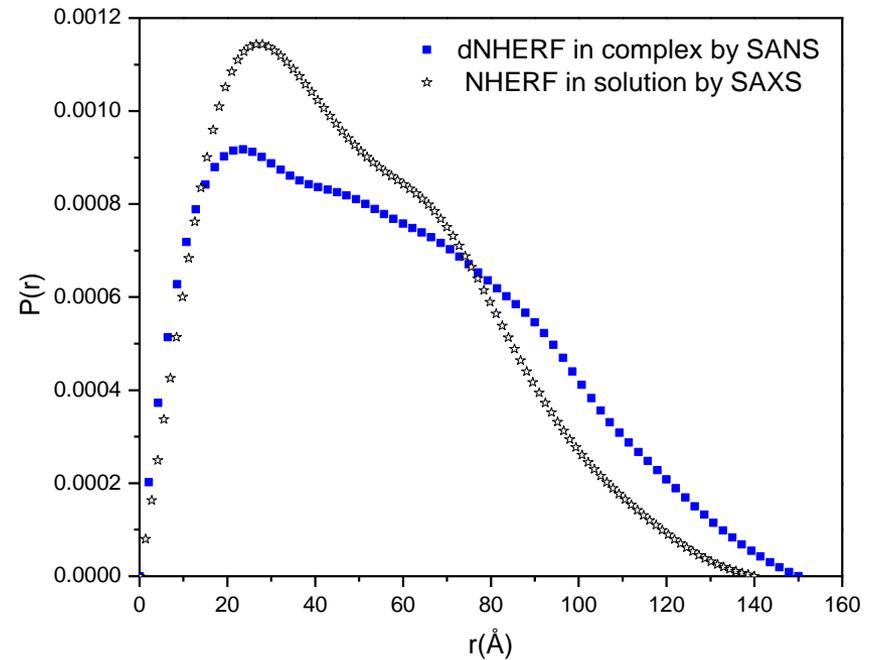

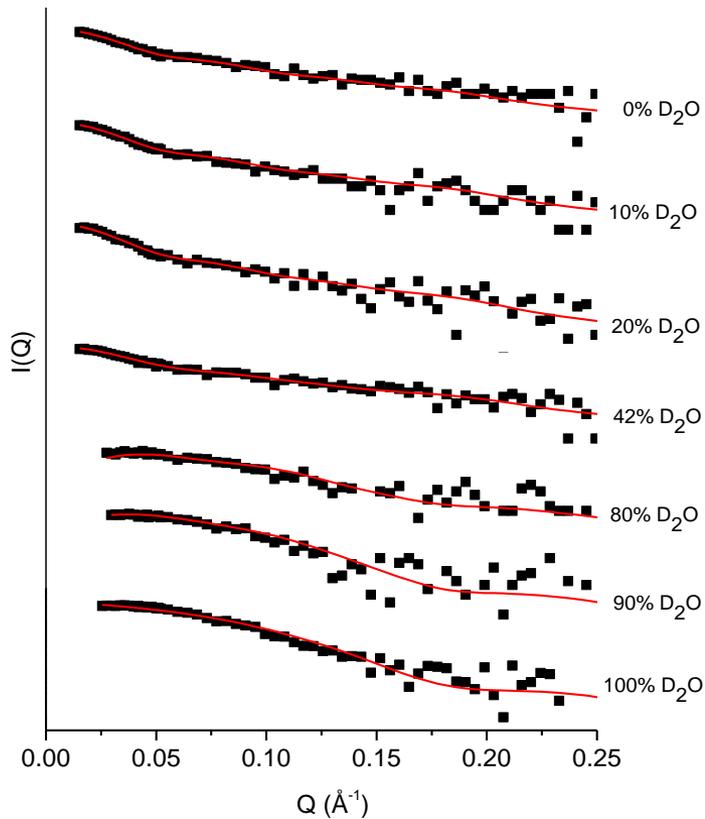

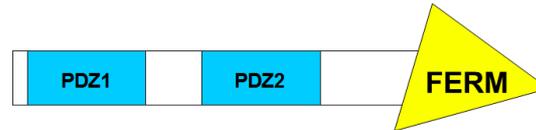

Selective deuteration and contrast variation SANS to study protein complexes

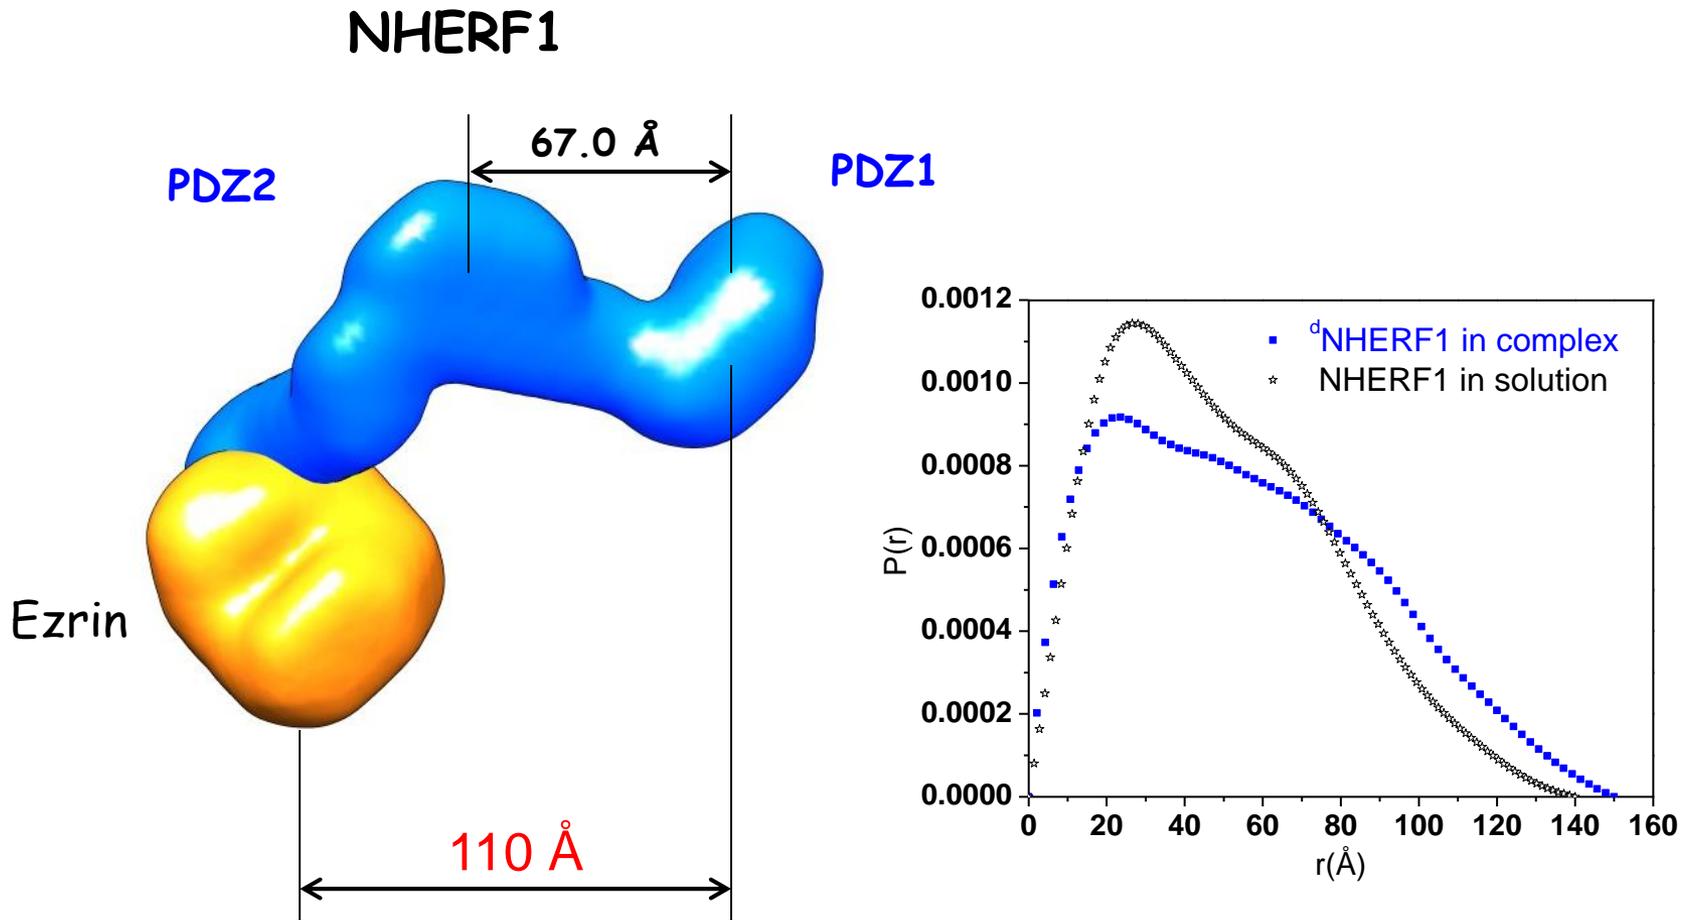

H	D	C	N	O	P	S
-0.3742	0.6671	0.6651	0.940	0.5804	0.517	0.2847

Contrast variation SANS: Conformational changes in NHERF1 upon binding to ezrin FERM domain

In 40% D₂O, at the contrast match point of unlabeled FERM

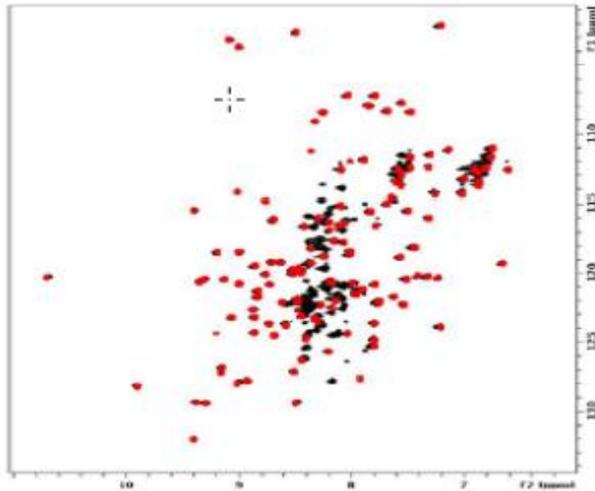

Structural changes in NHERF1 upon binding to ezrin

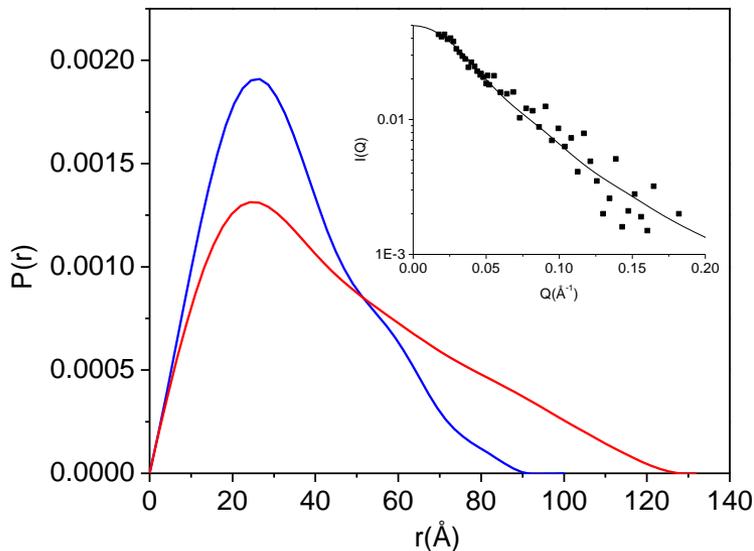

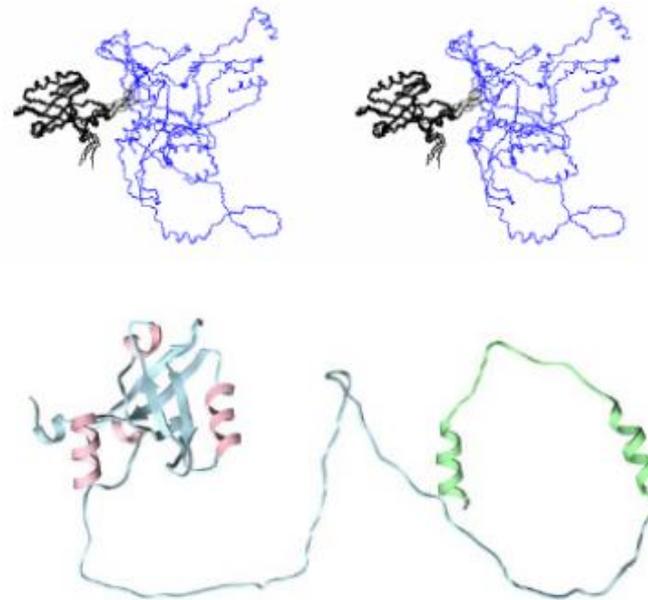

Ezrin-induces long-range interdomain allostery in NHERF1 (Li et al, JMB, 2009)

A conformational switch in the scaffolding protein NHERF1 controls autoinhibition and complex formation.

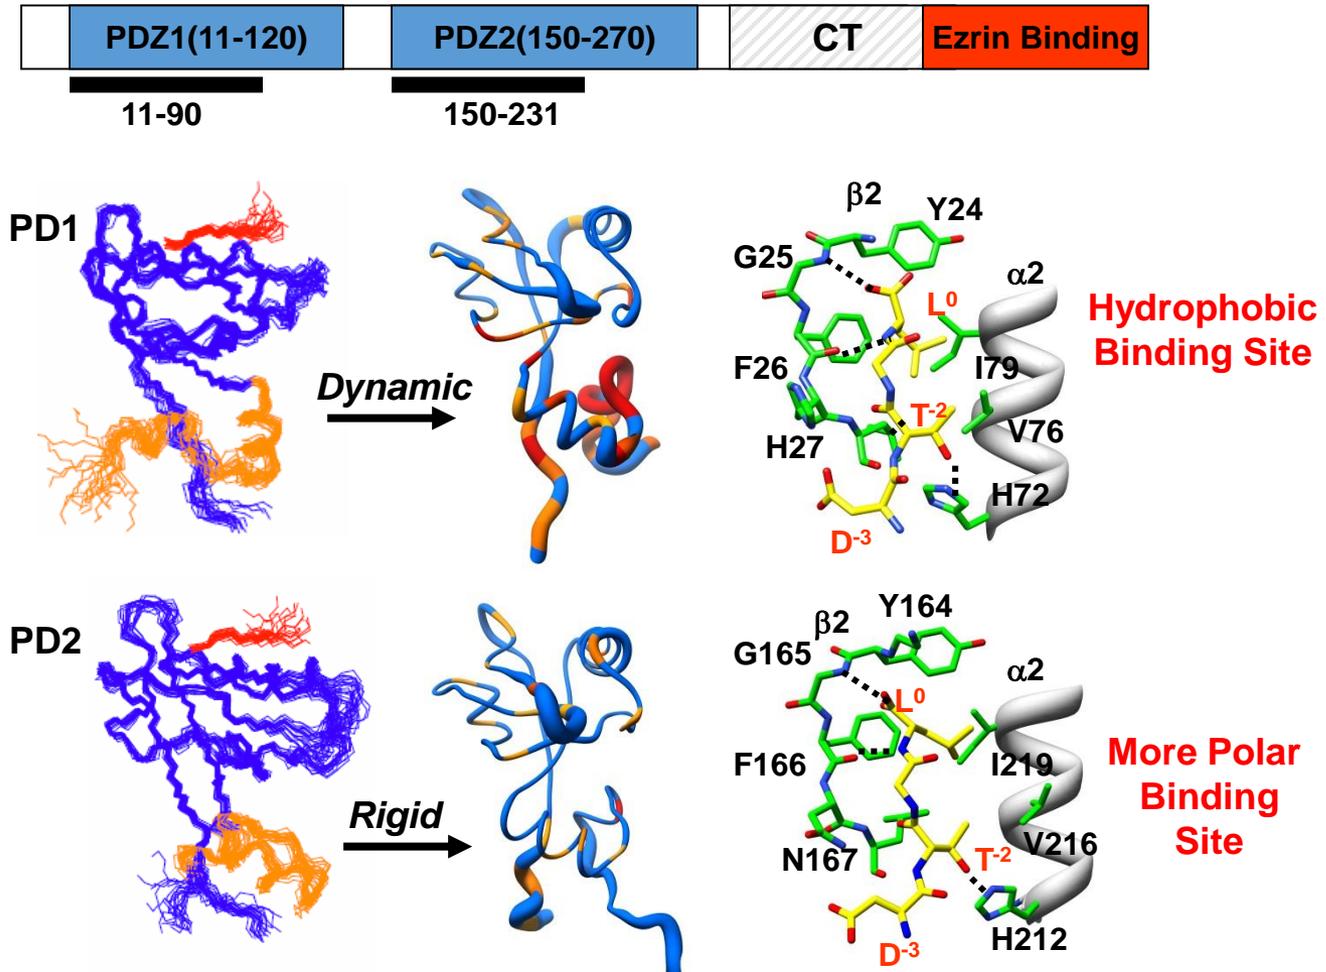

Structural transition in **PDZ2CT** upon binding to **FERM**—joint NMR and SANS refinement

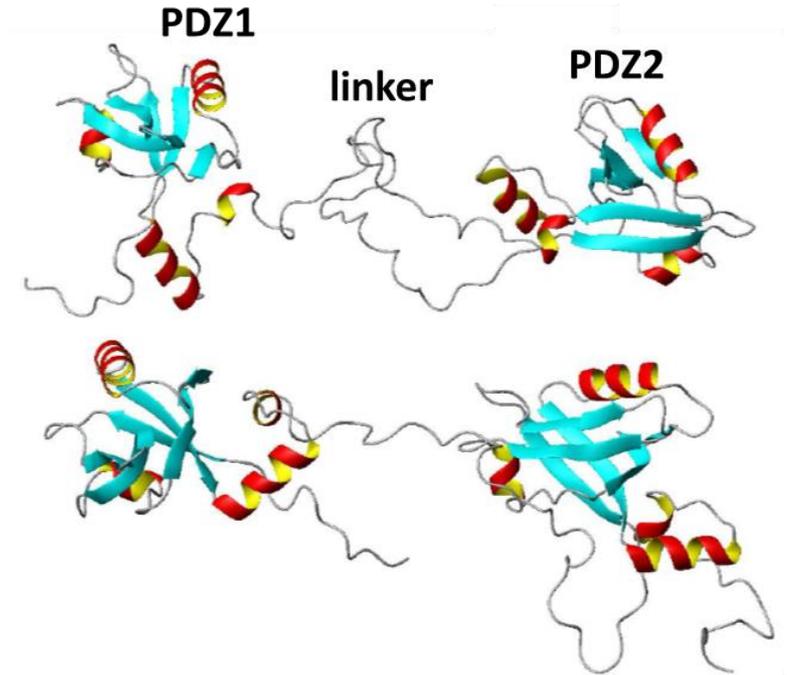

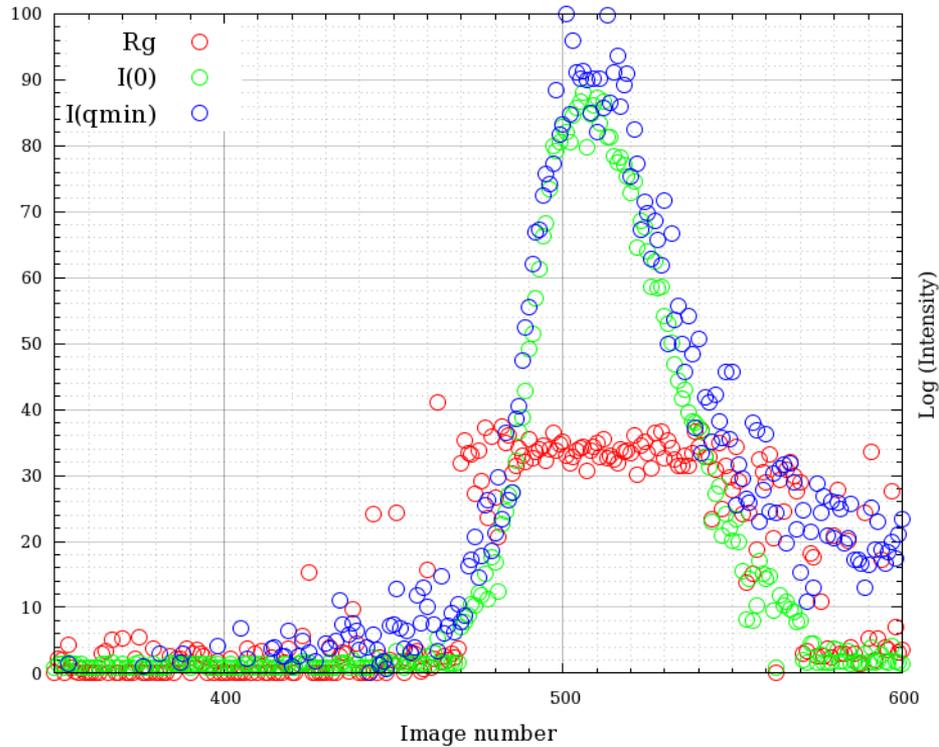

Bhattacharya et al, JBC, 2010

NMR Study of PDZ dynamics upon ligand binding

S. Bhattacharya et, al, JMB, 2013

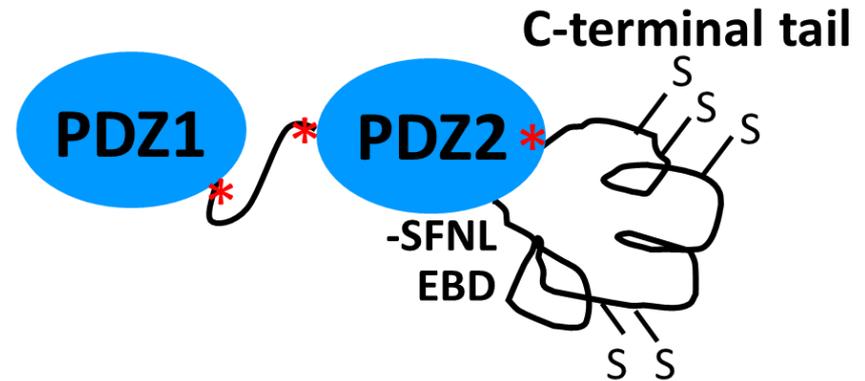

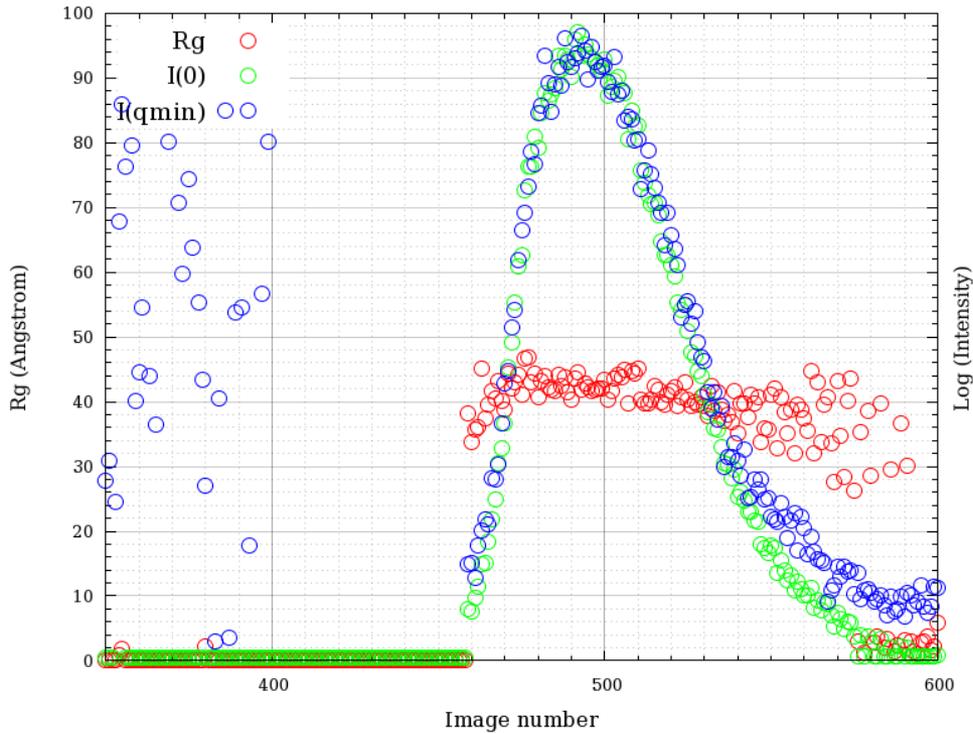

SEC-SAXS of PDZ1-PDZ2

Preliminary NMR Structure

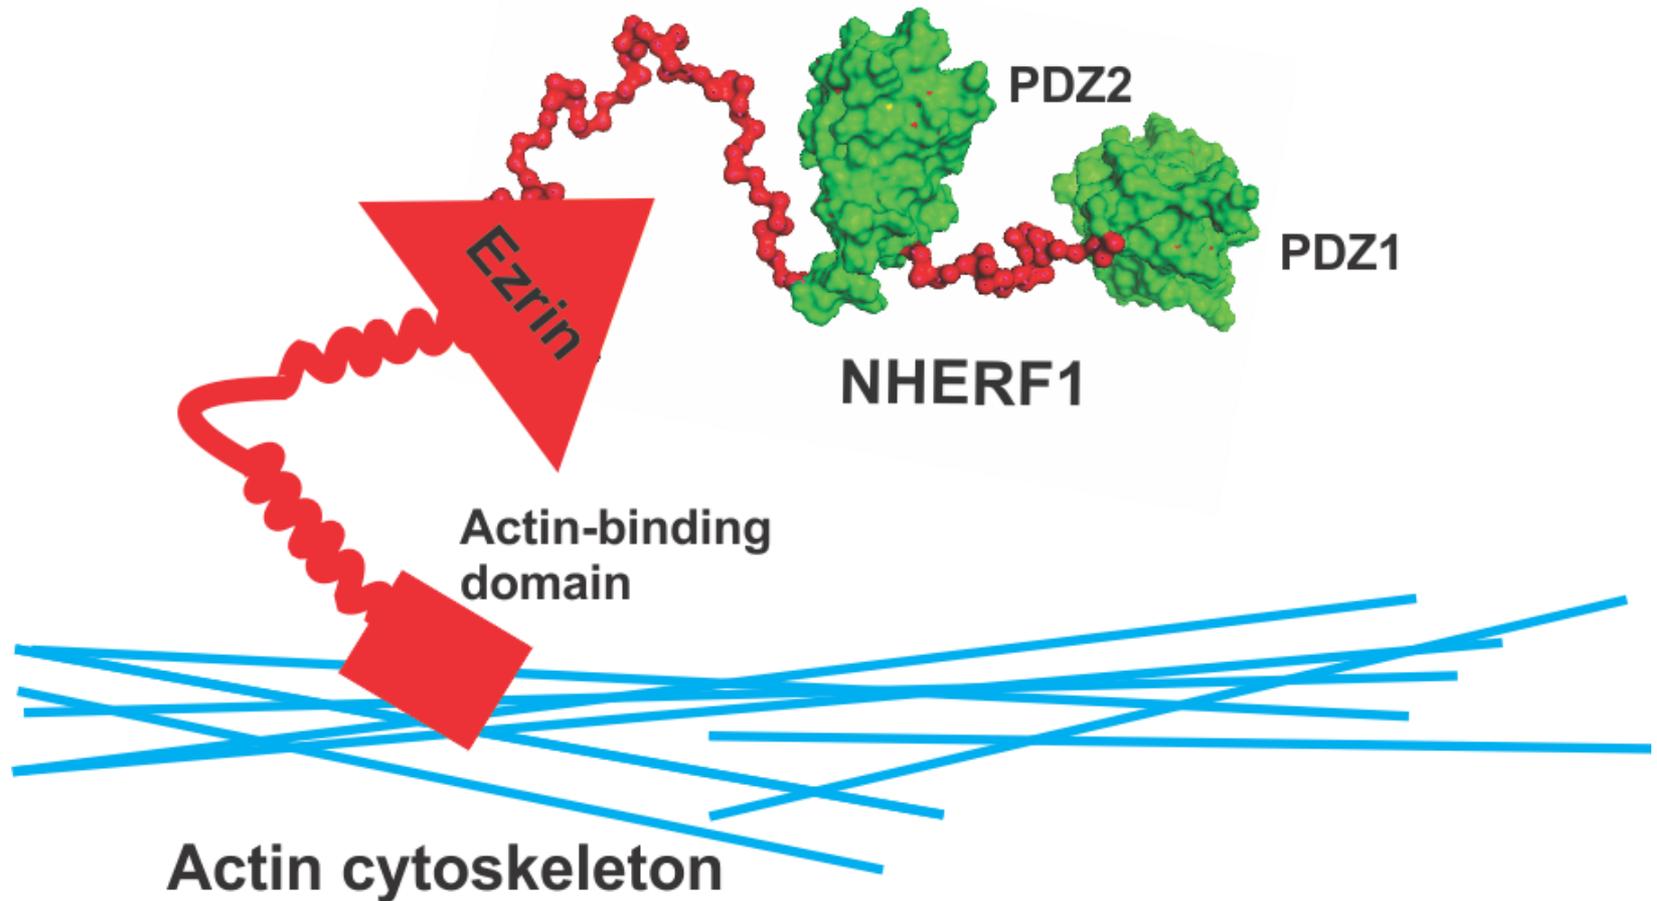

March, 2016, SSRL

Full-length NHERF1

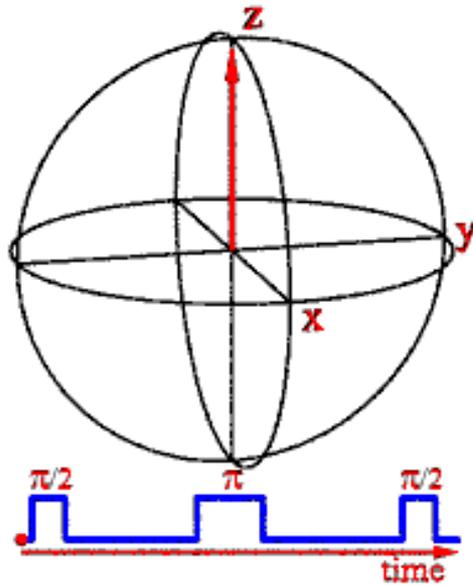

SEC-SAXS January, 2016, SSRL

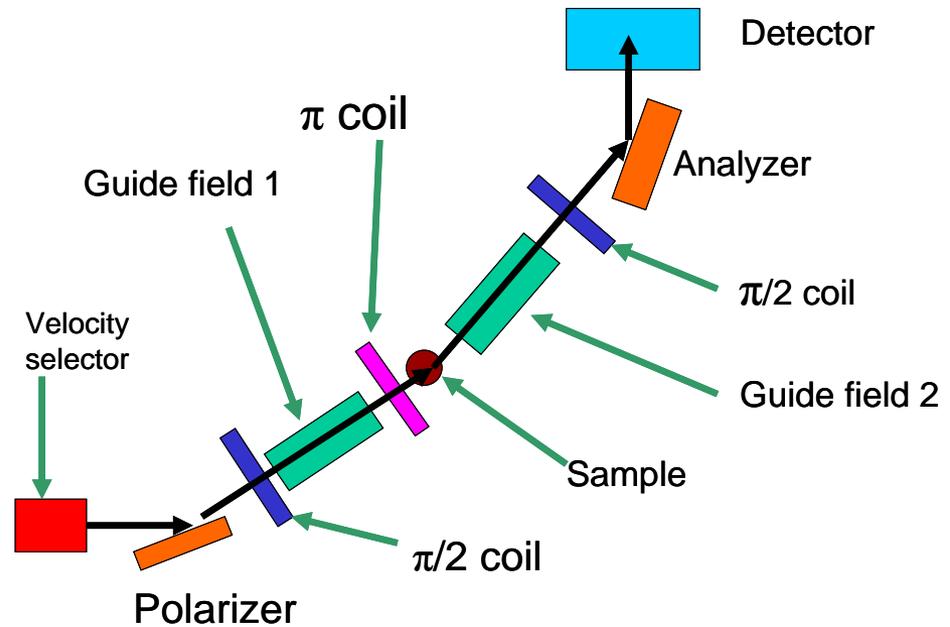

Propagation of long-range allostery

Applying neutron spin echo spectroscopy to study long-range protein domain motion

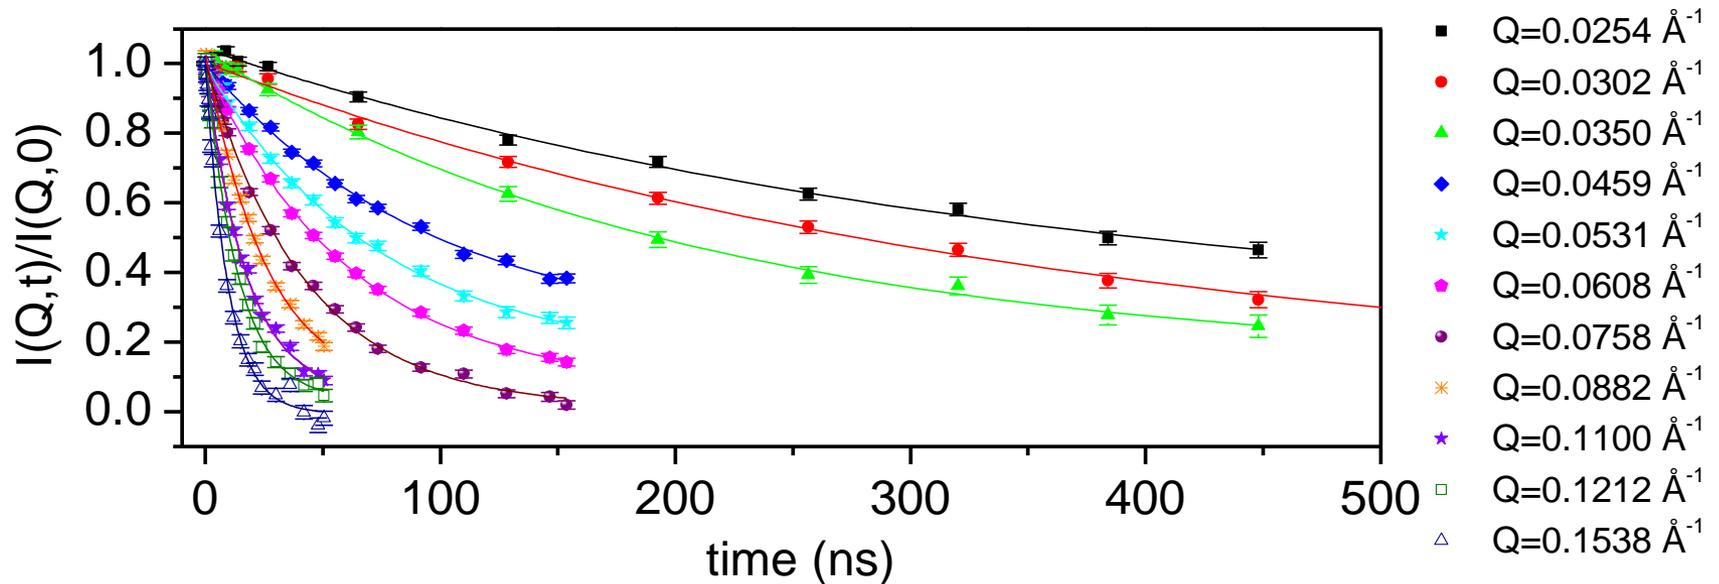

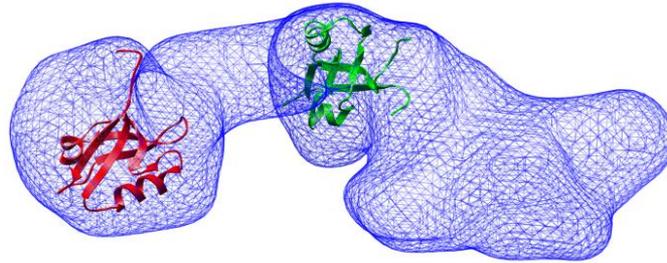

Ferenc Mezei

Nanosecond to microsecond time scales
10-1000 Å: nano length scales—**nanoscale motion**

NSE spectra on NHERF1 alone

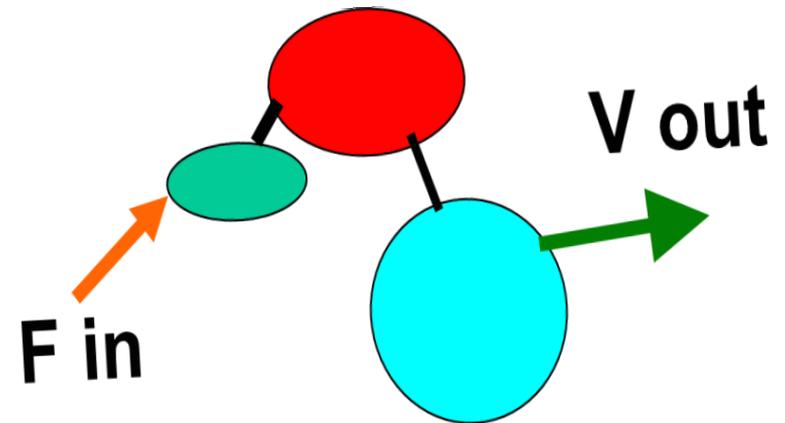

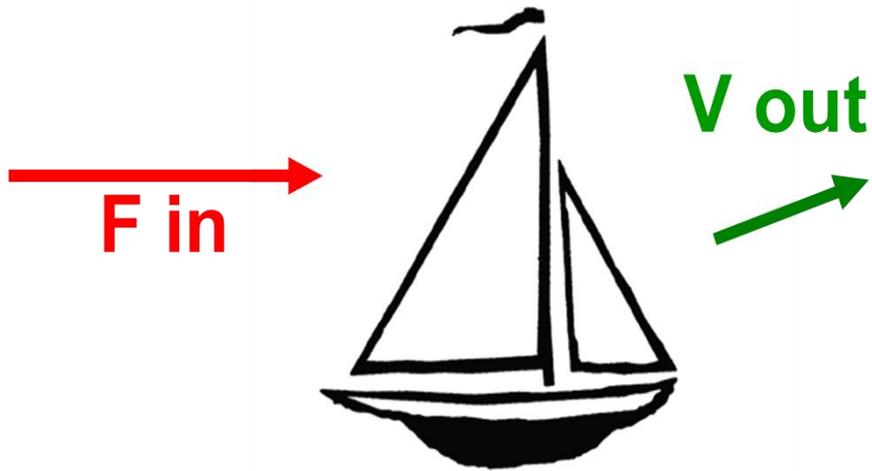

Protein motion—low Reynolds number

Overdamped creeping motions-

Effective diffusion constant
 $D_{\text{eff}}(Q)$

Mobility tensor $\vec{v} = \overset{\leftrightarrow}{H} \vec{F}$

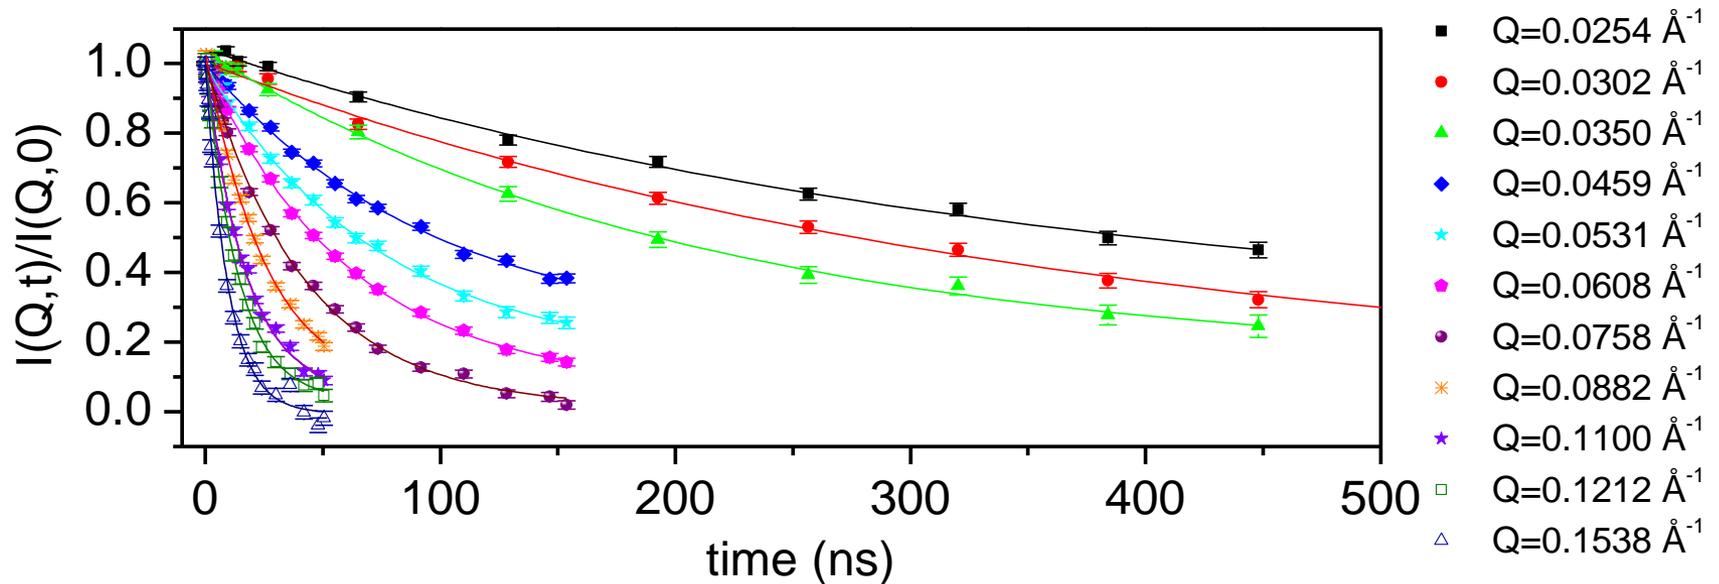

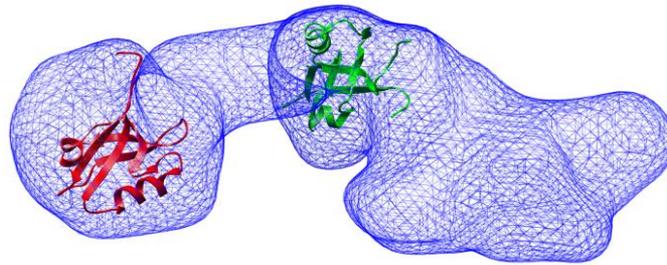

H is the **mobility tensor**, and yields the velocity of a **domain** given the force applied on it or another subunit. NSE yields H , given structure.

Bu et al, PNAS, 2005

Farago, Biophys. J., 2010

NSE spectra on NHERF1 alone

The Q dependence of the decay rates of the NSE measured correlation functions is defined by the **mobility tensor**

$$D_{eff}(Q) = \frac{k_B T}{Q^2} \frac{\sum_{jl} \left\langle b_j b_l \left(Q \cdot H_{jl}^T \cdot Q + L_j \cdot H_{jl}^R \cdot L_l \right) e^{iQ \cdot (r_j - r_l)} \right\rangle}{\sum_{jl} \left\langle b_j b_l e^{iQ \cdot (r_j - r_l)} \right\rangle}$$

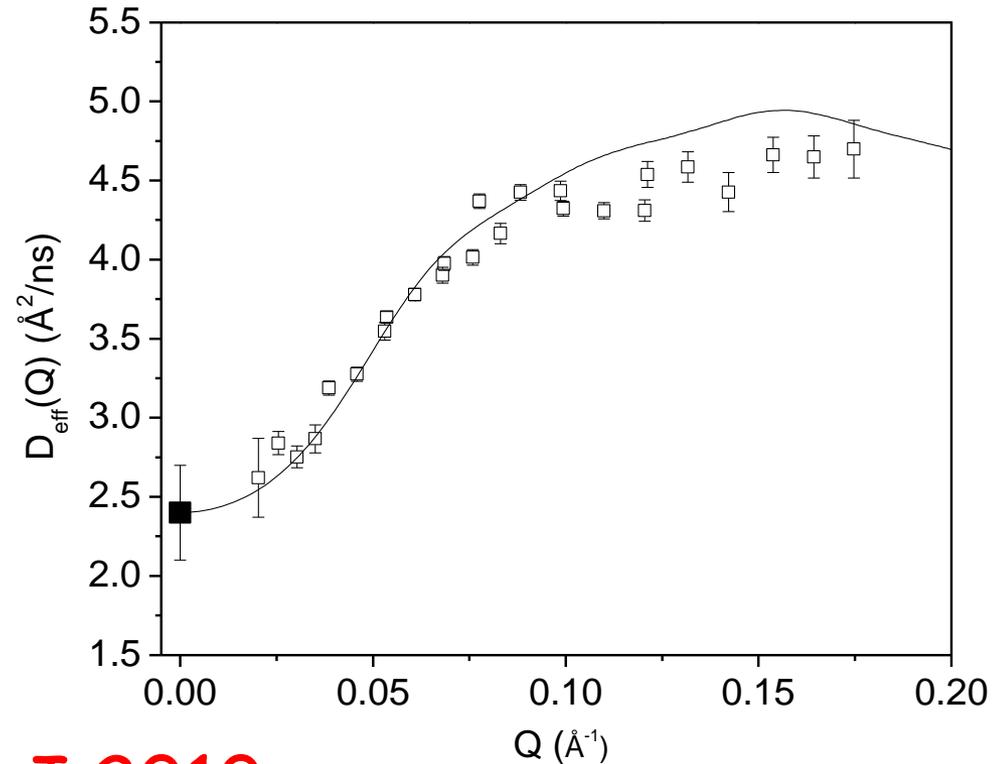

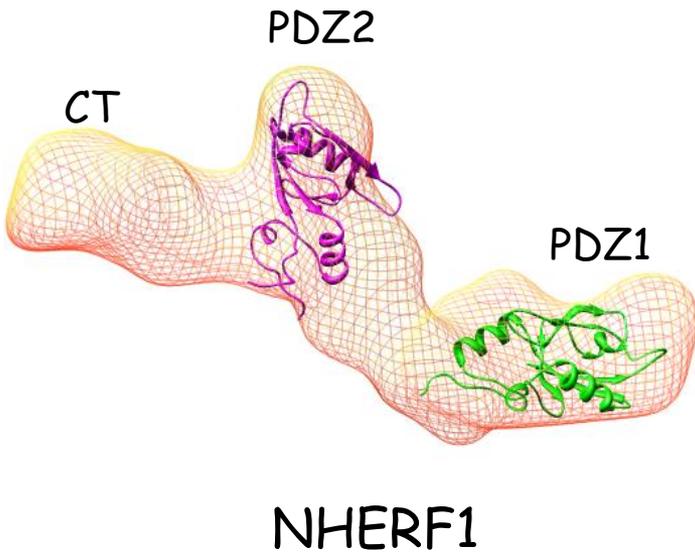

Mobility tensor H defines dynamics

$L_j = \mathbf{r}_j \times \mathbf{Q}$ is the angular momentum vector.

The angular velocity vector is given by $\boldsymbol{\omega} = \mathbf{H}^R \boldsymbol{\tau}$, with the torque $\boldsymbol{\tau} = \sum_n \mathbf{r}_n \times \mathbf{F}_n$.

$$\boldsymbol{\omega} = \mathbf{H}^R_{\Sigma mn} \mathbf{r}_m \times (\mathbf{N}^2 \mathbf{H}^T)^{-1}_{mn} (\boldsymbol{\omega} \times \mathbf{r}_n)$$

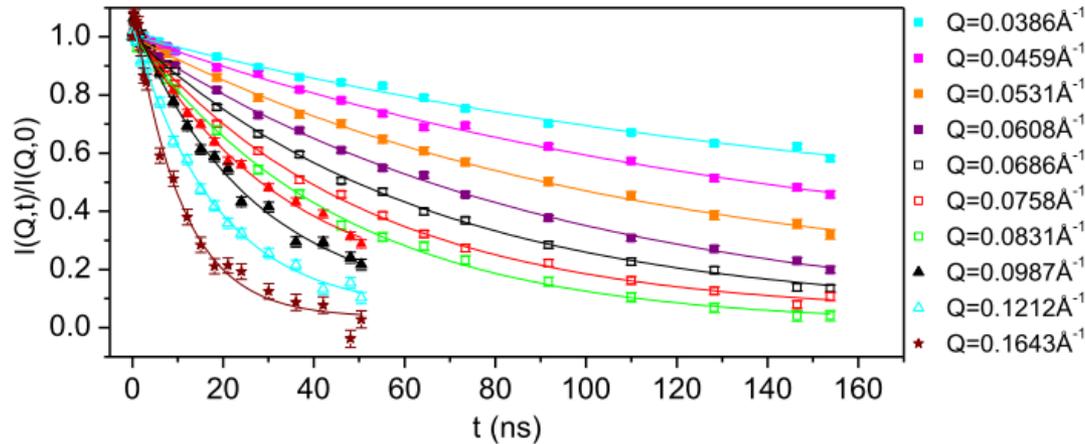

The dynamics of (unbound) NHERF1 alone is well described by a rigid-body model

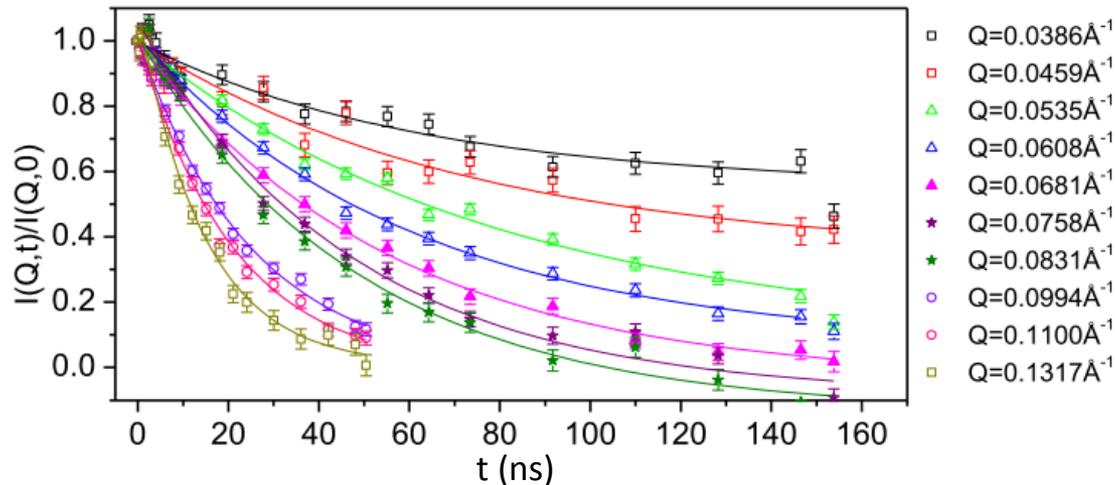

Farago et al Biophys J 2010

Only inputs to calculations are diffusion constant from PFG NMR and SANS coordinates—no need to fit NSE data or use MD!

NSE spectra on NHERF1-FERM complex

h NHERF1- h FERM complex

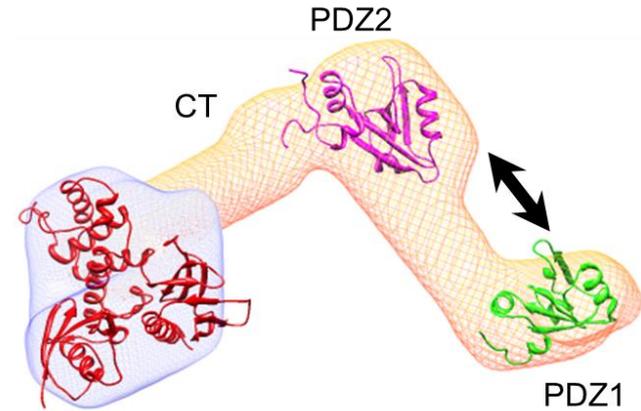

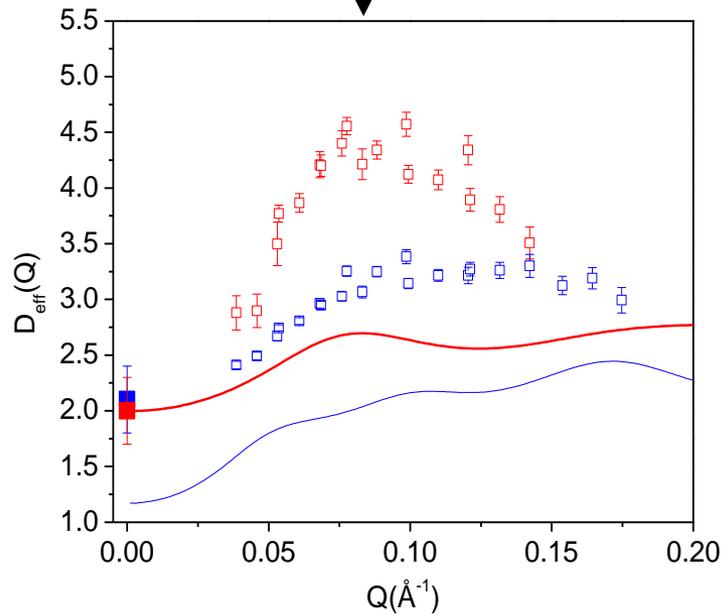

h NHERF1- d FERM complex

in D2O solution

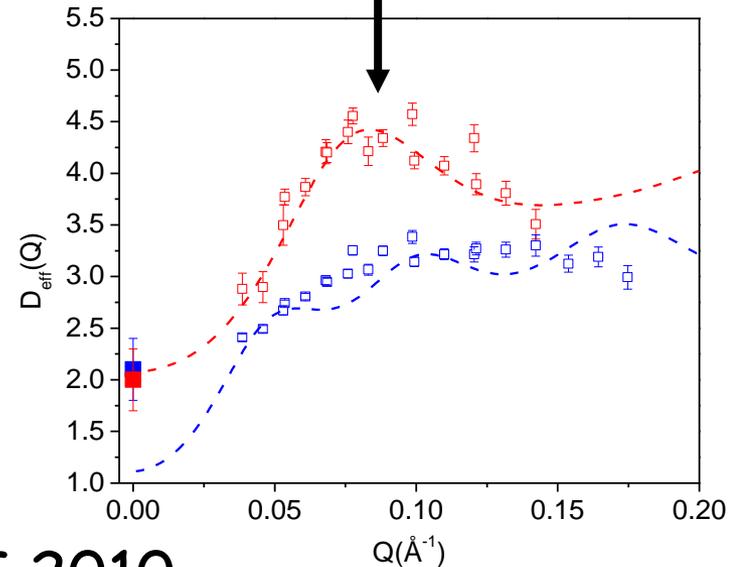

Binding to ezrin activates inter-domain motions in NHERF1 more than 100 Å away!!

Rigid body

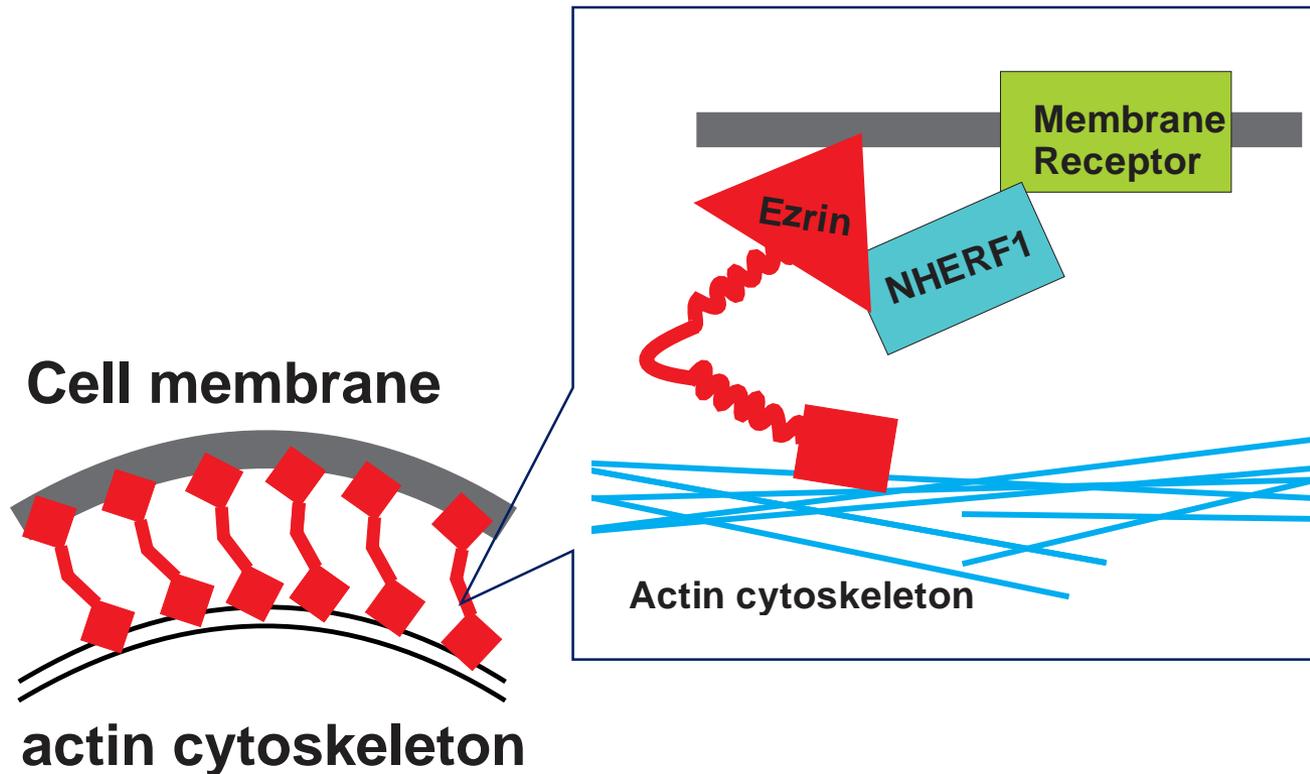

FERM

Inter-domain motion

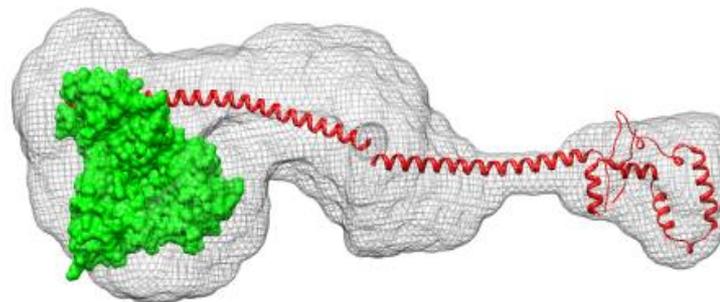

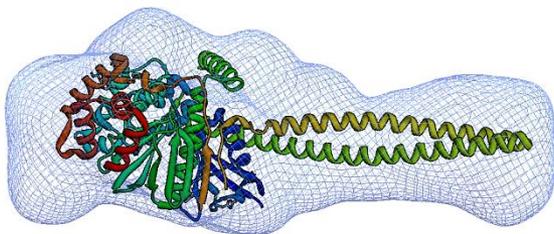

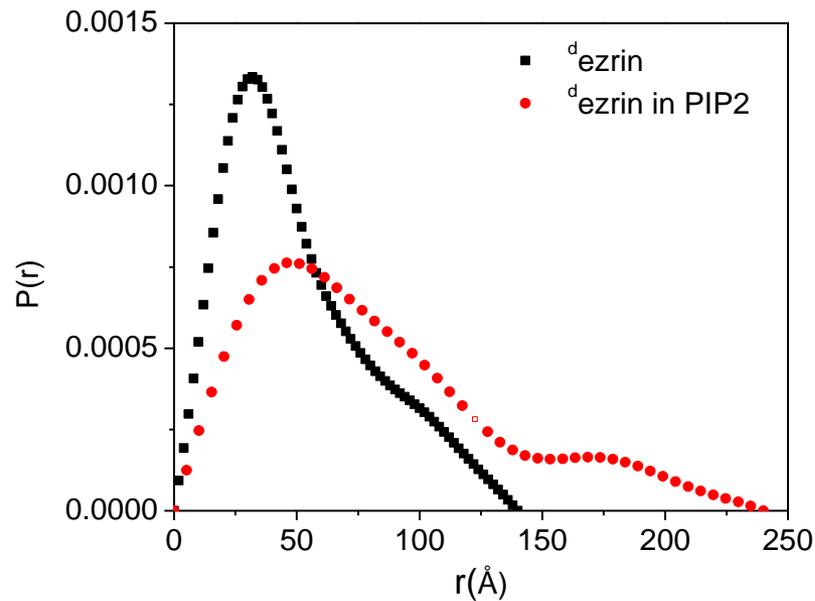

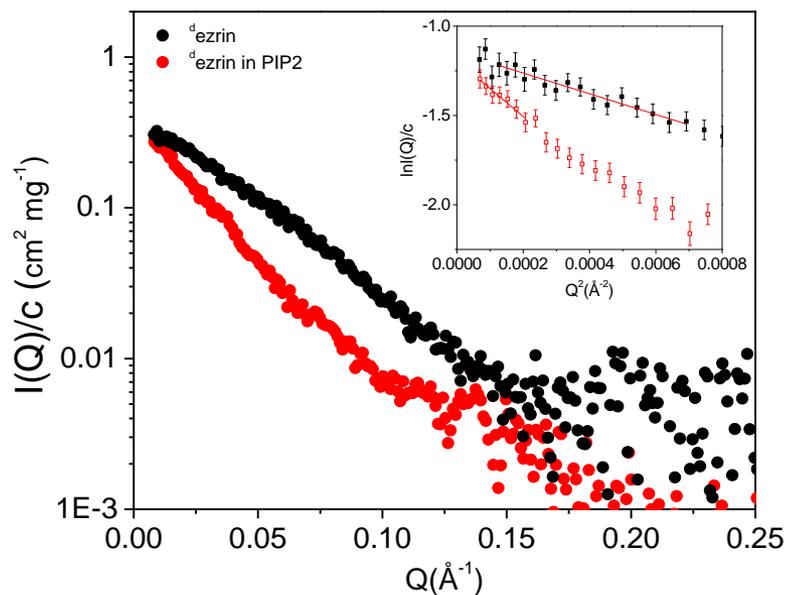

Farago et al Biophys J 2010

Adapter proteins **NHERF1** and **Ezrin** regulate membrane receptor and ion channel assembly, trafficking and signaling

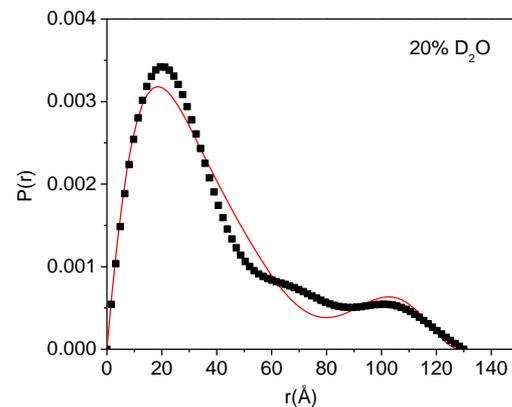

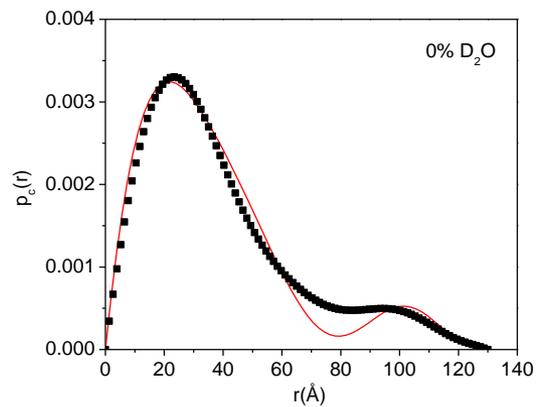

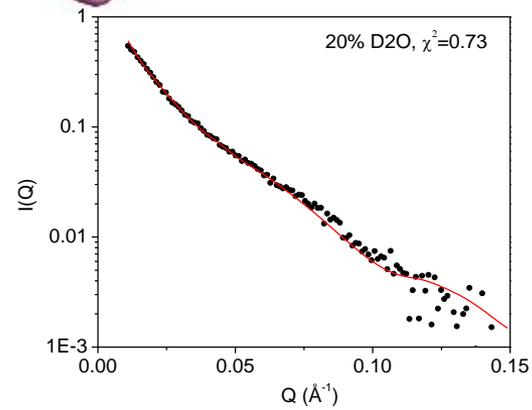

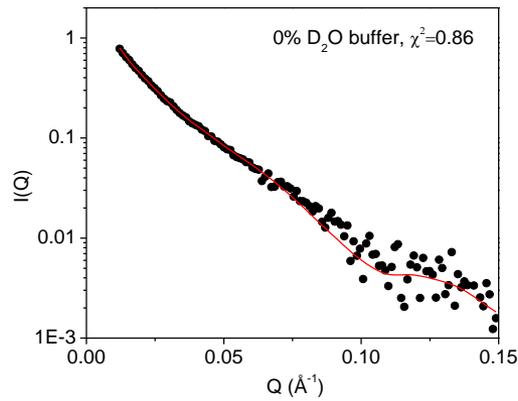

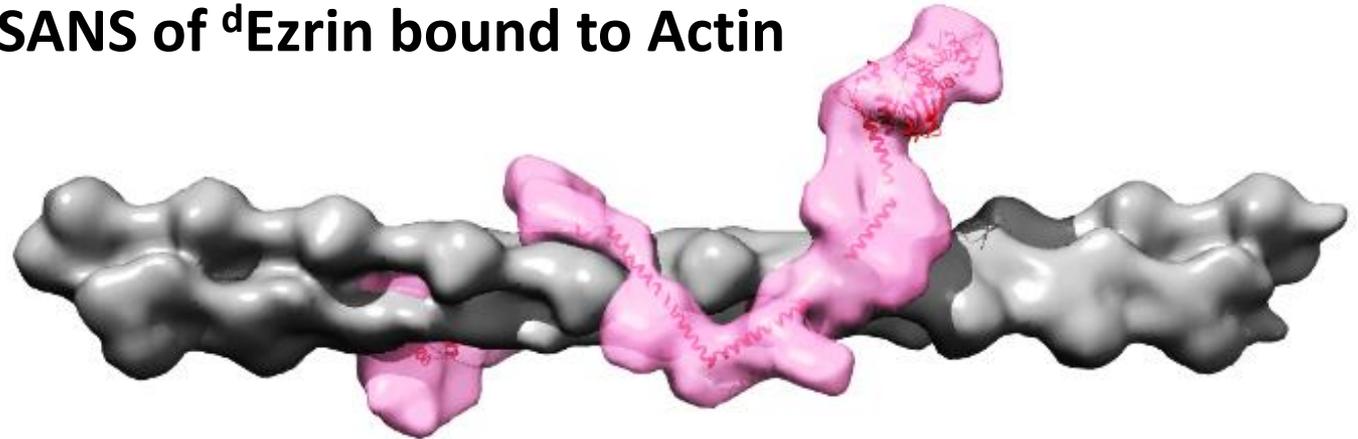

Linking the cell membrane to the F-actin cytoskeleton

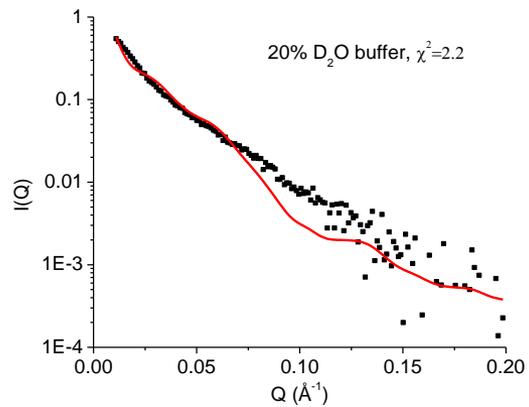

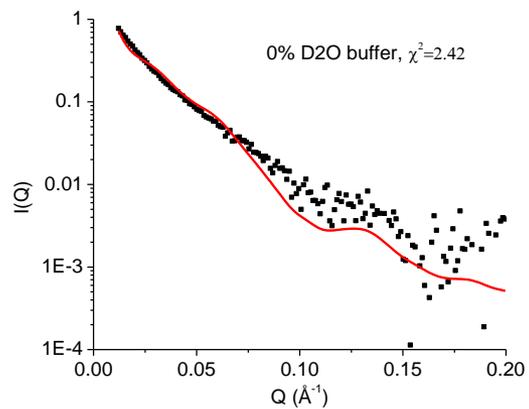

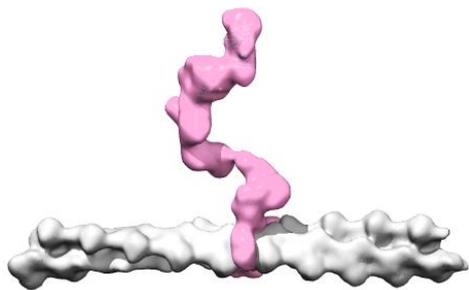

SANS reveals the open conformation of Ezrin in PIP2 in 20% D2O

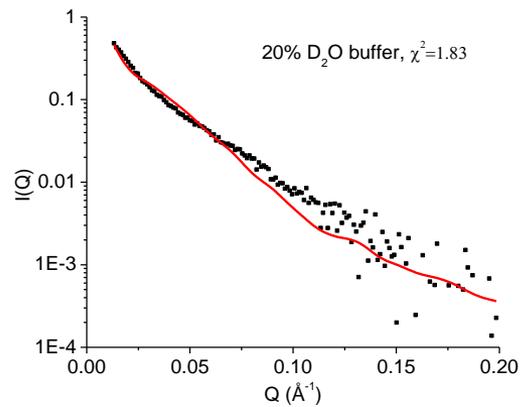

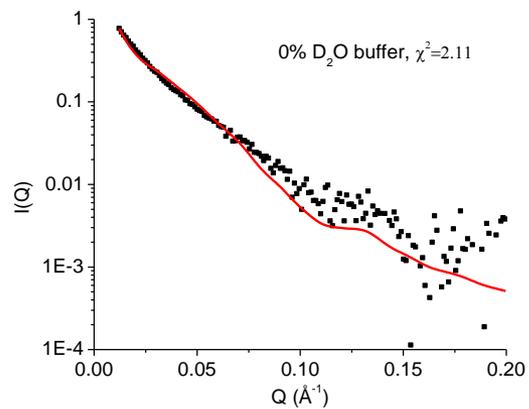

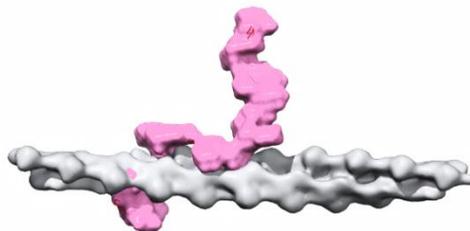

Contrast variation SANS of ^dEzrin bound to Actin

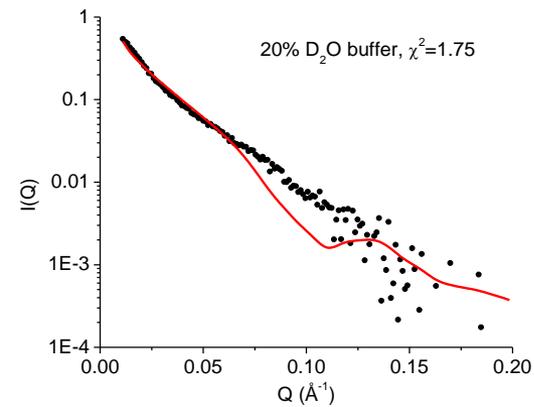

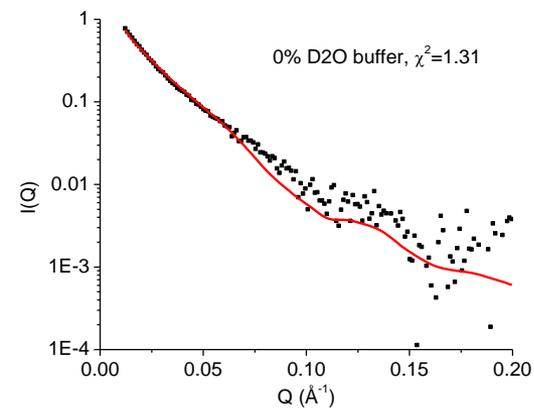

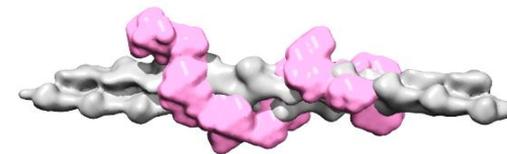

(A)

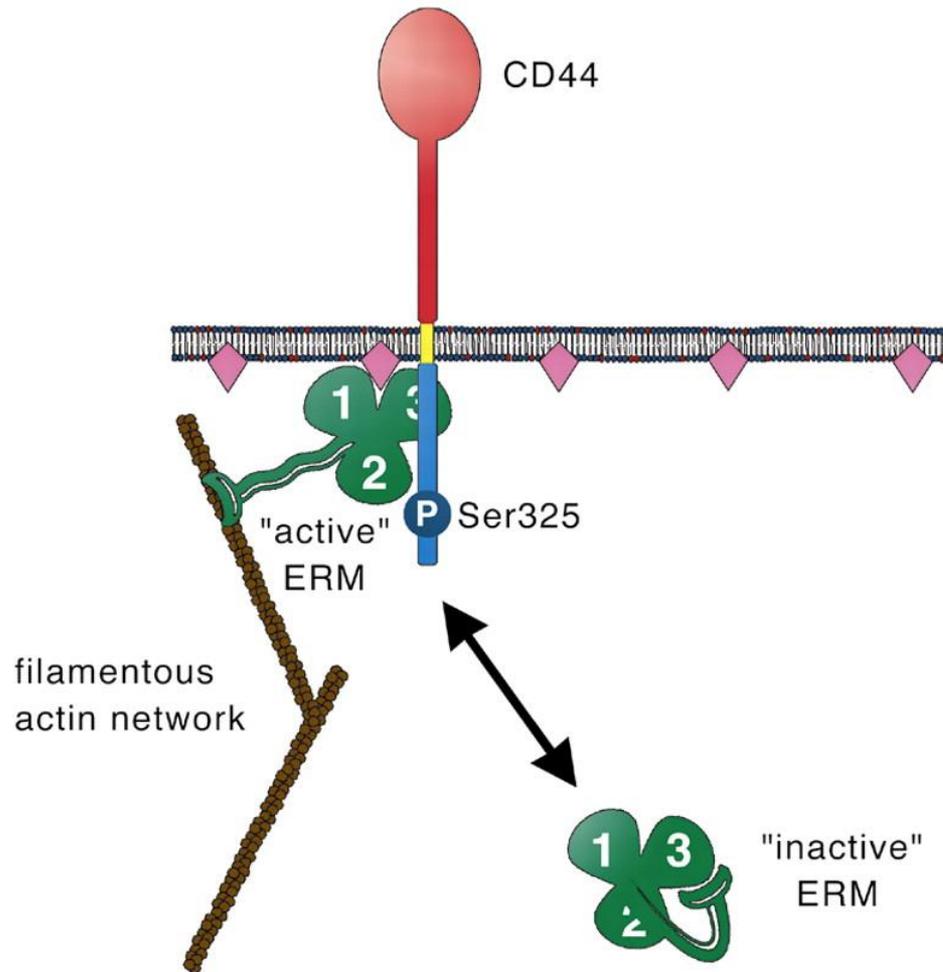

(B)

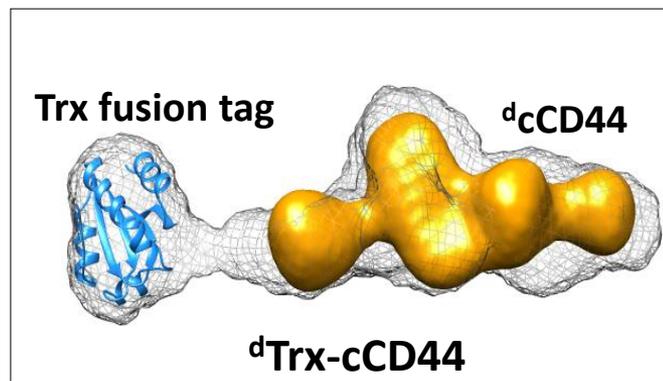

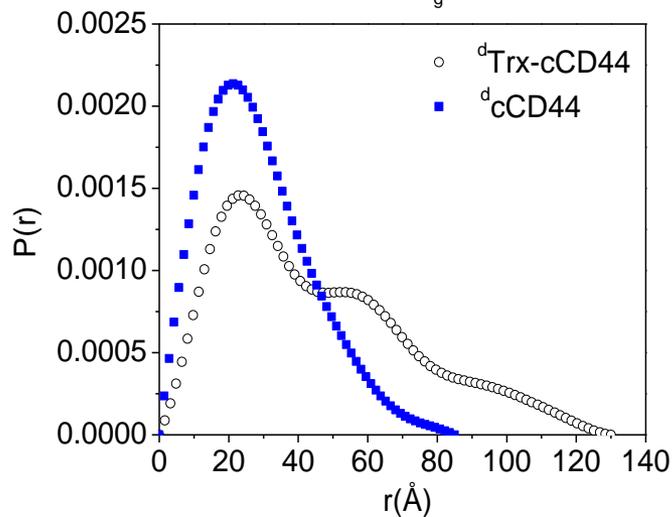

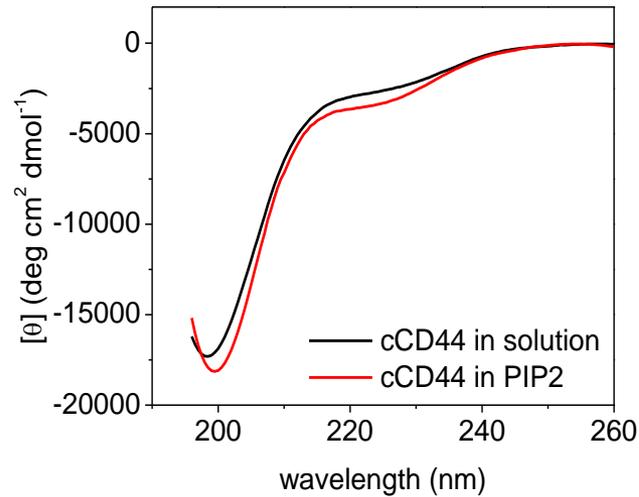

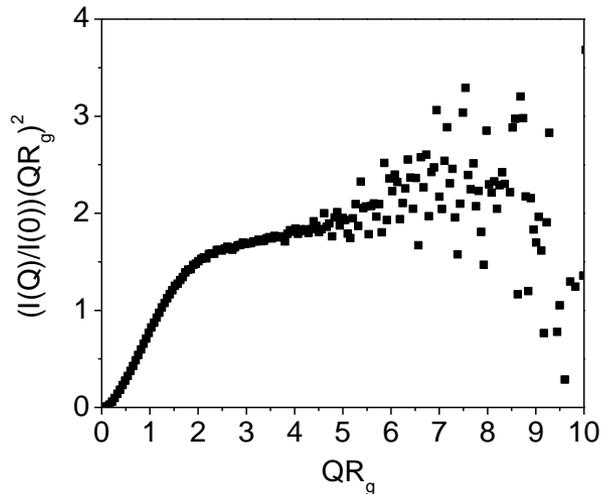

(C)

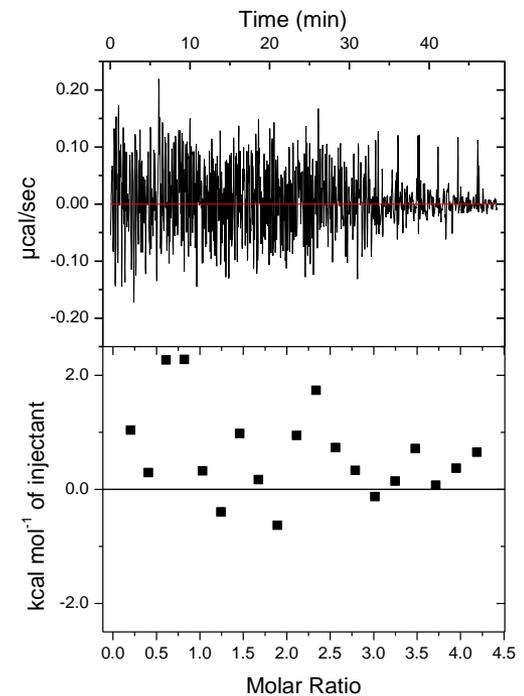

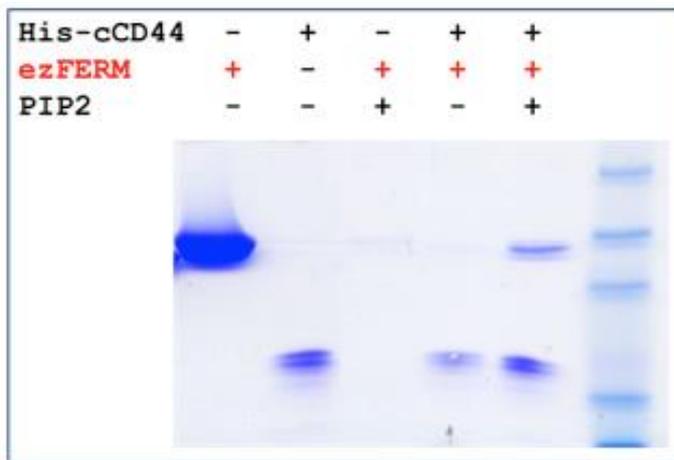

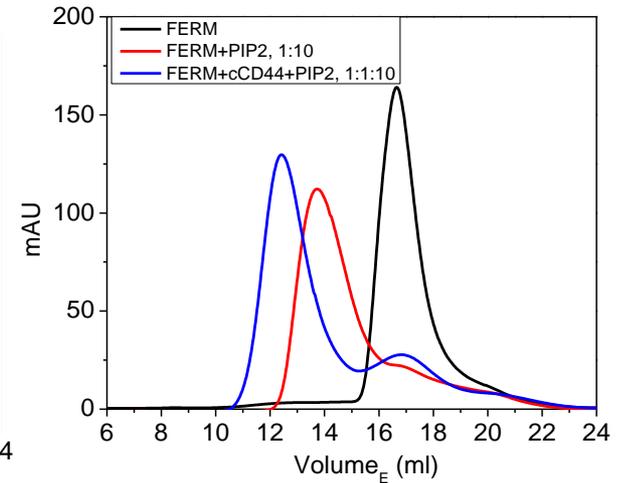

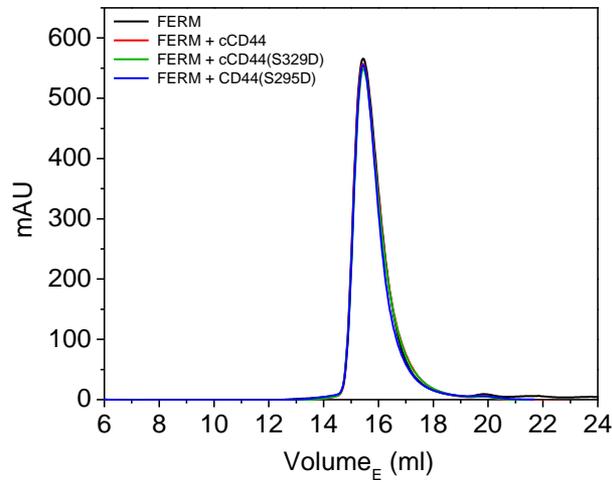

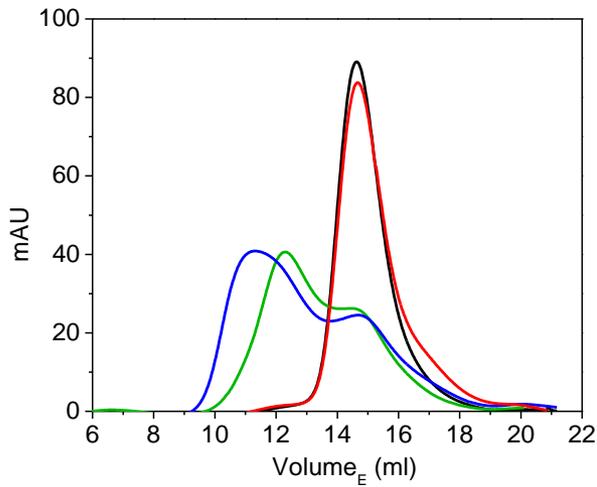

CD44 a single transmembrane protein involved in cell migration cell-cell adhesion and cell-matrix adhesion

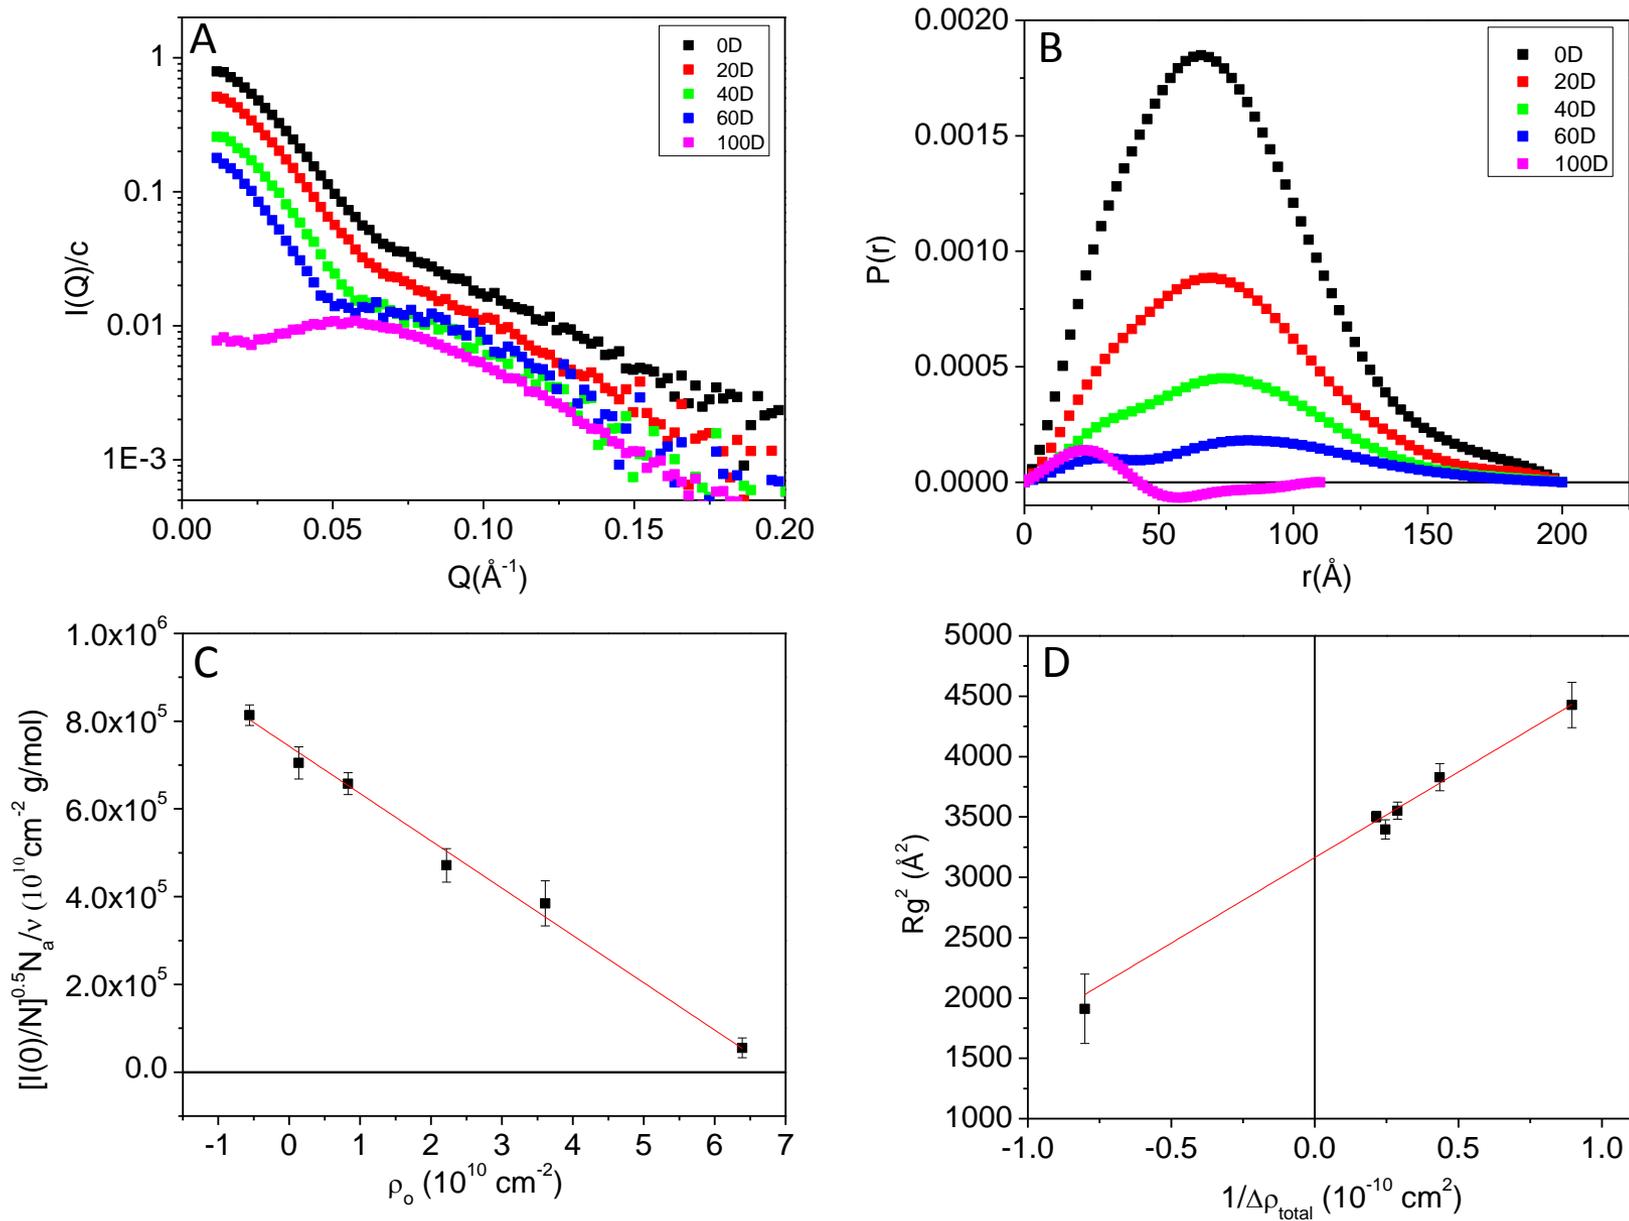

The cytoplasmic tail of CD44 adopts a collapsed and molten globule like conformation

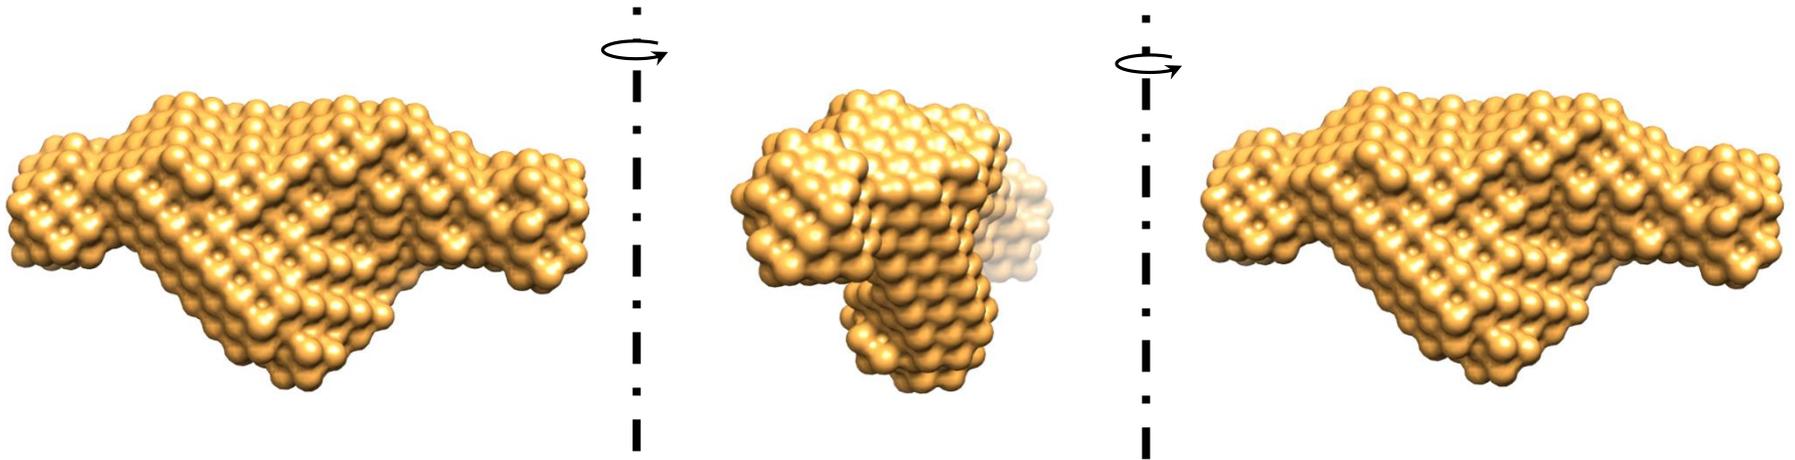

Only in PIP2, CD44 binds to Ezrin, or the FERM domain of Ezrin

Contrast variation SANS on PIP2/^dcCD44/^dFERM

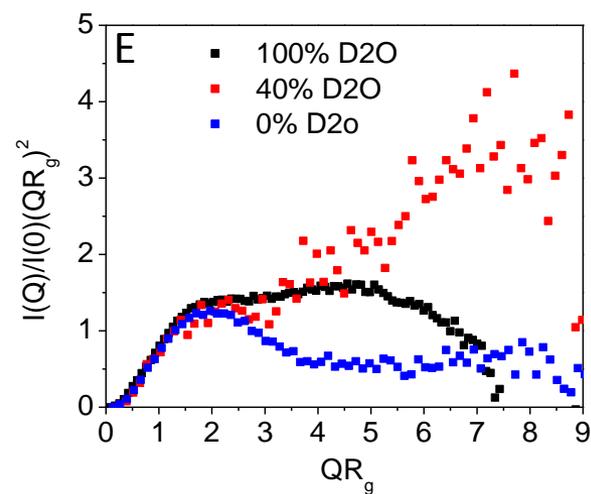

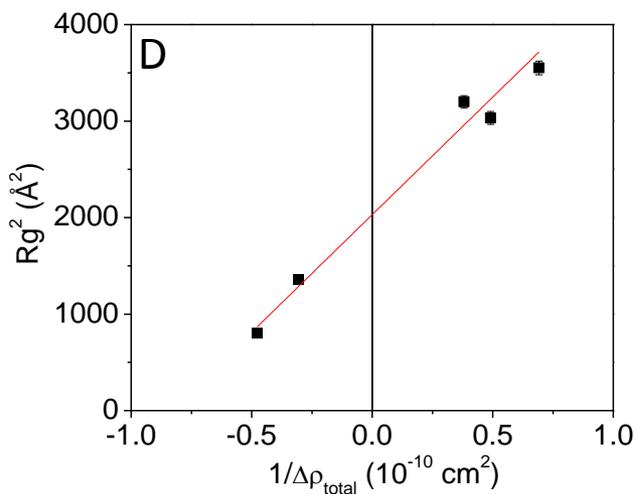

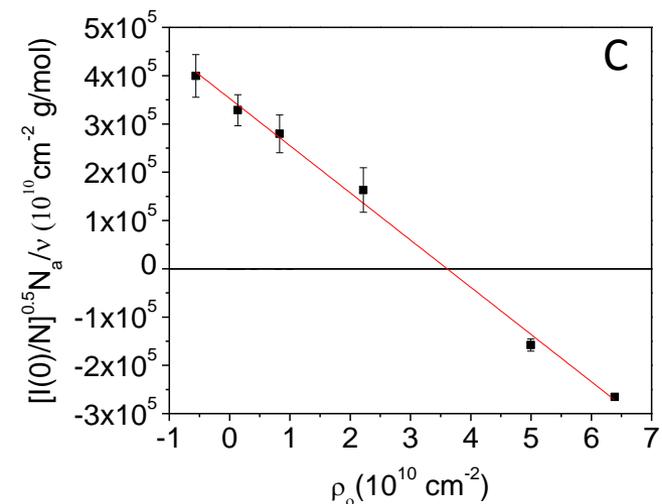

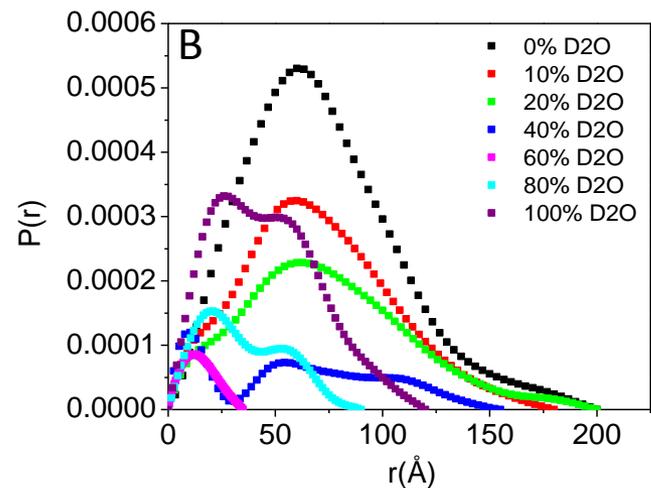

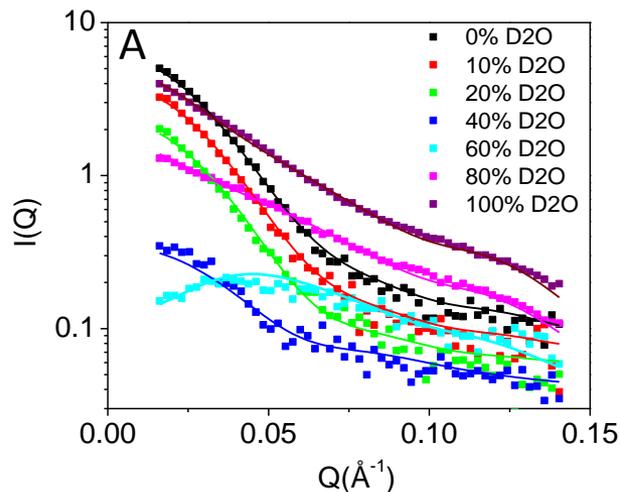

3-D image of PIP2/^dcCD44/^dFERM

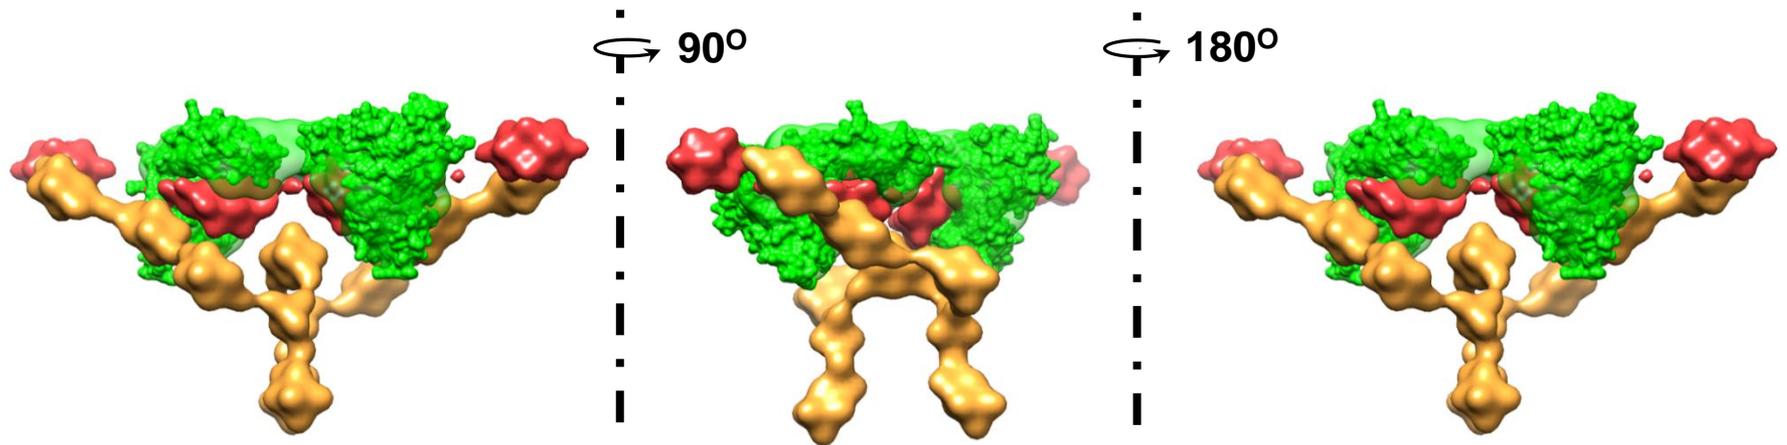

Dammin of SANS data in 20% D2O at the contrast-matching point of PIP2

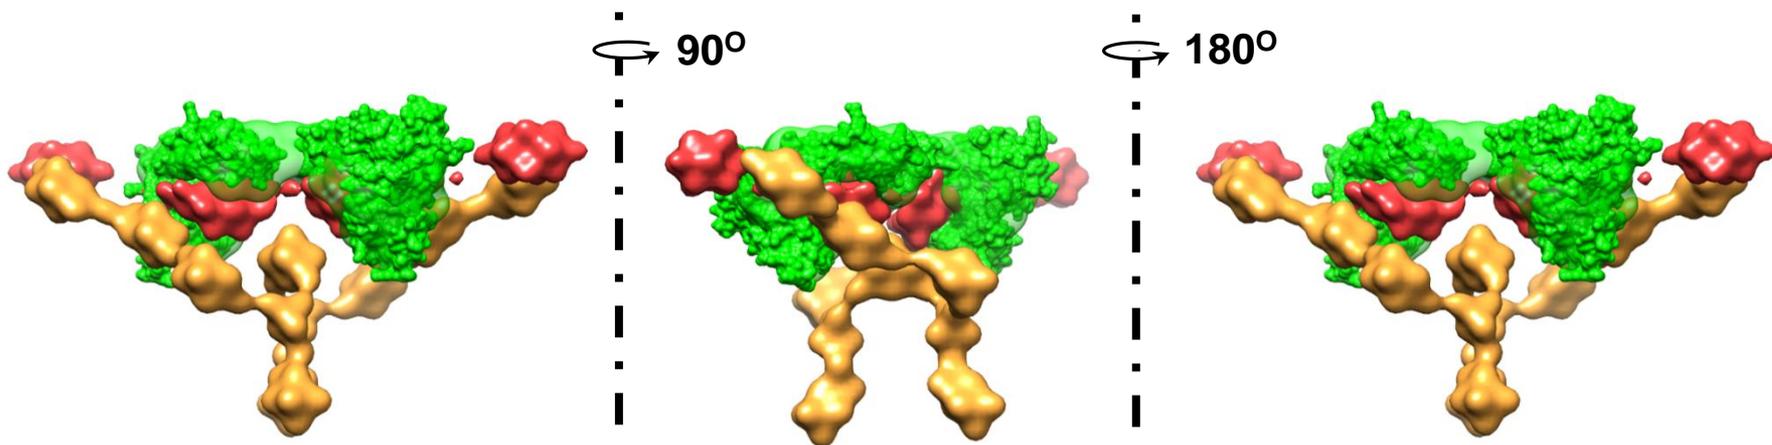

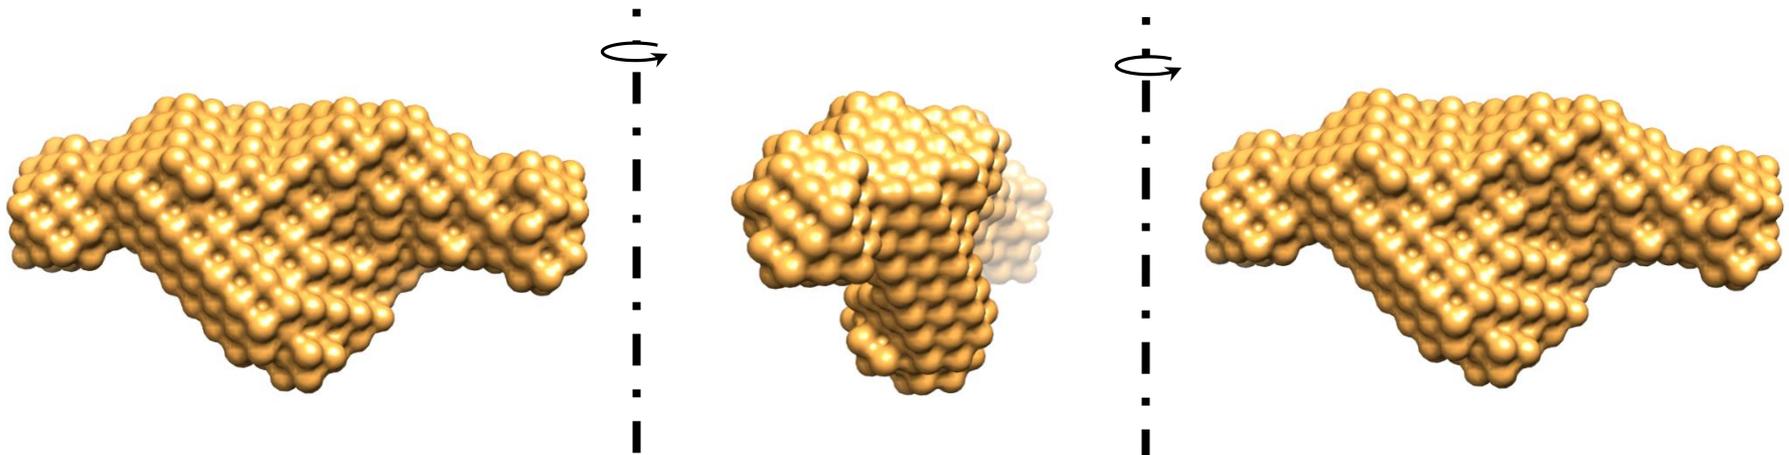

Contrast variation SANS on PIP2/^dcCD44/^hFERM

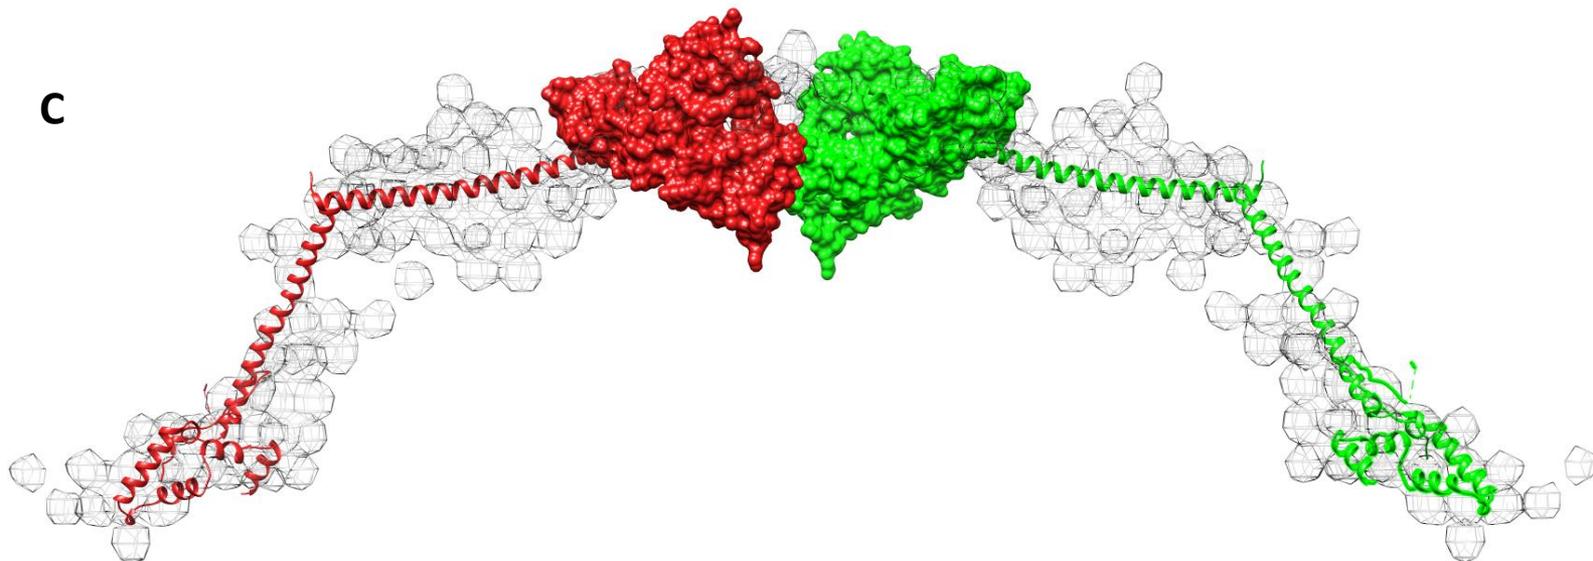

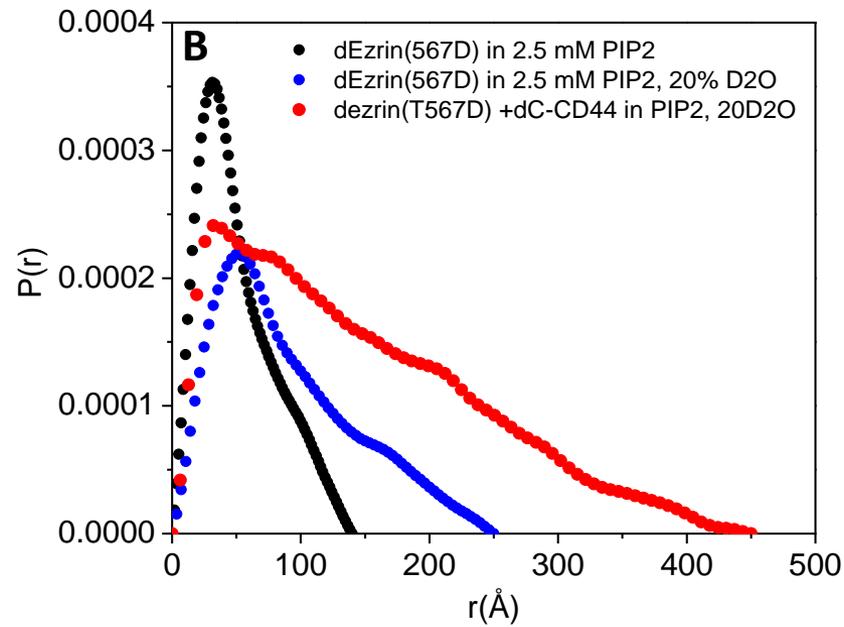

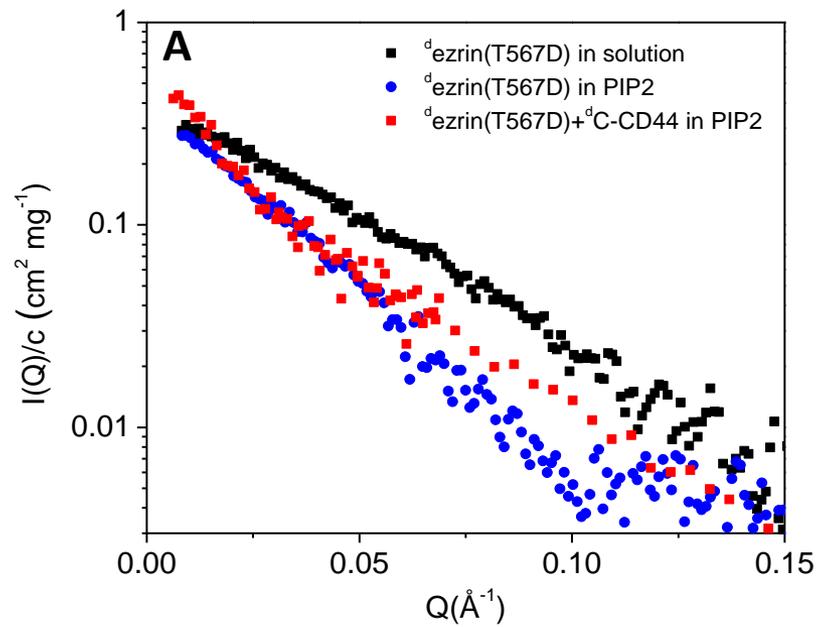

3-D image of PIP2/^dCD44/^hFERM

MONSA using SANS data at all contrasts

PIP2 activates the cytoplasmic tail of CD44 and facilitates the assembly of a CD44·Ezrin hetero-tetramer complex
